

(1) Several quantities in almost all equations are not described anywhere in the paper.

(2) The reason for the cross-talk is unclear. why there should be cross-talk at the input of the amplifiers? In a MIMO system, cross-talk among antennas at the output of power amplifiers is much more likely?

(3) A single programmable signal generator should be sufficient to generate all required signals.

(4) The connections of the measurement setup on figure 1 are unclear. please draw a clear block diagram of what is is being done.
