Errata

Title & Document Type: **5216A Electronic Counters Operating and Service Manual**

Manual Part Number: **05216-9006**

Revision Date: **August 1971**

About this Manual

We've added this manual to the Agilent website in an effort to help you support your product. This manual provides the best information we could find. It may be incomplete or contain dated information, and the scan quality may not be ideal. If we find a better copy in the future, we will add it to the Agilent website.

HP References in this Manual

This manual may contain references to HP or Hewlett-Packard. Please note that Hewlett-Packard's former test and measurement, life sciences, and chemical analysis businesses are now part of Agilent Technologies. The HP XXXX referred to in this document is now the Agilent XXXX. For example, model number HP8648A is now model number Agilent 8648A. We have made no changes to this manual copy.

Support for Your Product

Agilent no longer sells or supports this product. You will find any other available product information on the Agilent Test & Measurement website:

www.agilent.com

Search for the model number of this product, and the resulting product page will guide you to any available information. Our service centers may be able to perform calibration if no repair parts are needed, but no other support from Agilent is available.

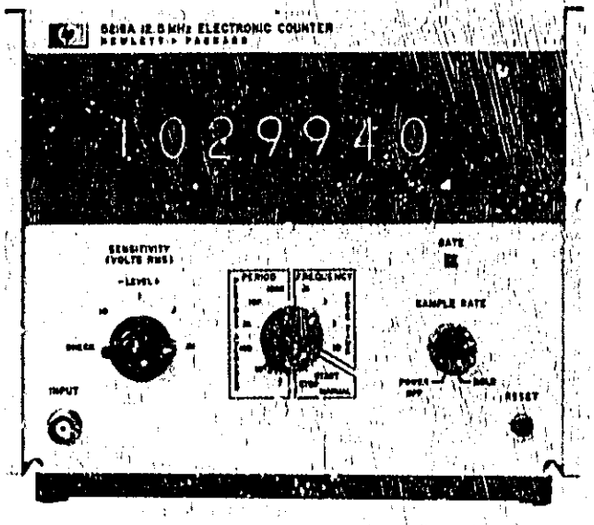
OPERATING AND SERVICE MANUAL

ELECTRONIC COUNTER
5216A



HEWLETT hp PACKARD

HP 5216A

ELECTRONIC COUNTER

5216A

H/P Part No. 05216-9006

SERIAL PREFIX: 1040A

This manual applies directly to HP Model 5216A Electronic Counters having serial prefix number 1040A.

SERIAL PREFIXES NOT LISTED

For serial prefixes above 1040A, a "Manual Changes" sheet is included with this manual. For serial prefixes below 1040A, refer to Section VII, Manual Changes.

MANUAL CONTENT

This manual is supplied to help you make best use of your instrument. The manual covers 8 sections of information as follows:

Section I is an introduction to the instrument. Electrical specifications are given, plus information on accessories.

Section II covers inspection, power, mounting, packing, shipping and connection.

Section III outlines operating procedures.

Section IV discusses technical details of circuit operation.

Section V provides performance check, troubleshooting and adjustment procedures.

Section VI lists replaceable parts.

Section VII gives information on manual changes.

Section VIII contains circuit diagrams with component location.

HOW TO ORDER

To order an operating and service manual, contact your nearest Hewlett-Packard Sales and Service office. Give complete model, name and 8- or 9-digit serial number. The serial number plate is on the rear panel (see Paragraph 1-7 for serial number system). Comments on this manual are welcome at any Sales and Service Office.

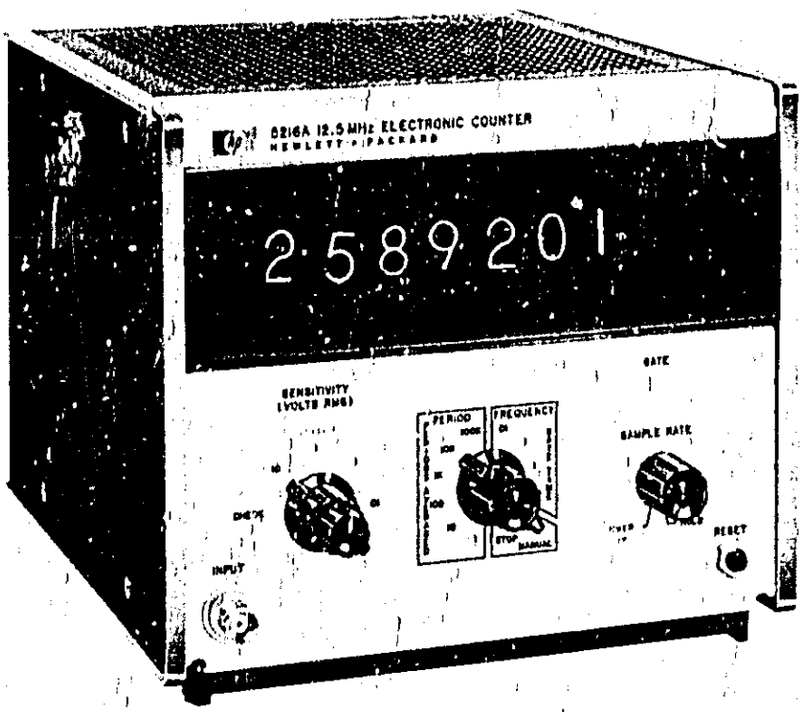
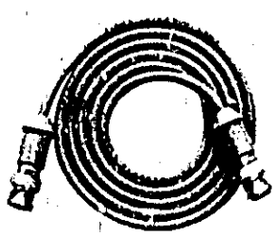
MODEL 5216A



BNC TO BNC CABLE



POWER CORD

SECTION I

GENERAL INFORMATION

1-1. INTRODUCTION

1-2. The Hewlett-Packard Model 5216A is a 12.5 MHz Electronic Counter that makes frequency measurements, period measurements, period average measurements, ratio measurements, totalizing and time interval measurements. All electrical and mechanical specifications are given in Table 1-3. The HP Model 5216A provides these additional features:

a. Standard output frequency of 1 MHz.

b. Display storage permits readings to be displayed while new count is being made.

c. Blanking feature suppresses the display of unwanted zeros when storage is on.

d. Seven digit display using digital display tubes; decimal point position and measurement units displayed automatically.

e. Four-line BCD code output of 1248 "1" state positive provided for use with digital recorder.

f. Remote reset control is available through rear panel BNC with contact closure to ground.

1-3. EQUIPMENT SUPPLIED

1-4. Equipment supplied with the Model 5216A is listed in Table 1-1.

1-5. ACCESSORIES AVAILABLE

1-6. Accessories available for the Model 5216A are listed in Table 1-2.

1-7. IDENTIFICATION

1-8. Hewlett-Packard uses a two-section serial number mounted on the rear panel. Earlier instruments use an 8-digit serial number (000-00000). The first three digits are a serial prefix number; the last five digits refer to the specific instrument. Later instruments use a 9-digit serial number (0000A00000). The first four digits are the serial prefix and the last five digits refer to the specific instrument.

1-9. If the serial prefix of your instrument differs from that listed on the title page of this manual, there are differences between this manual and your instrument. Lower serial prefixes are documented in Section VII, and higher serial prefixes are covered with manual change sheets included with the manual. If the change sheet is missing, contact the nearest Hewlett-Packard Sales and Service Office listed on the inside rear cover of this manual.

Table 1-1. Equipment Supplied

Description	HP Part No.
Detachable power cord: 7-1/2 feet (231 cm) long, NEMA plug	8120-1348
Cable: 4 feet (122 cm) long, male BNC connectors	10503A

Table 1-2. Accessories Available

Description	HP Part No.
Digital Recorder	5050A
Recorder interconnecting cable	10513A
Rack Mount Adapter Frame	5060-0797
Combining Case	1052A

Table 1-3. Model 5216A Specifications

FREQUENCY MEASUREMENT

Range: 3 Hz to 12.5 MHz.

Input: 10 mV rms sine wave, max. sensitivity. Approx. 1 MΩ shunted by 50 pF input impedance.

Gate Times: 10, 1, 0.1, 0.01 s.

Accuracy: ±1 count ±time base accuracy.

Readout: 7 long-life Nixies®, reads in MHz and kHz with positioned decimal point.

TIME INTERVAL MEASUREMENT

Range: 10 µs to 10 s.

Input: Contact closure or saturated NPN transistor to ground. Signal duration ≥ 1 µs. Current sinking ≥2 mA. The START signal must end before the STOP signal begins. Time from STOP to next START: ≥30 ms for external reset or ≥ 30 ms plus sample time for internal reset.

Frequency Counted: 1 MHz internal time base or external frequency standard.

Readout: ms with positioned decimal point.

PERIOD MEASUREMENT

Range: 3 Hz to 1 MHz single period; to 2 MHz in multiple periods averaged.

Periods Averaged: 1, 10, 10^2, 10^3, 10^4, 10^5.

Input: 10 mV rms maximum sensitivity; 100 mV rms below 1 kHz.

Frequency Counted: 1 MHz internal time base or external frequency standard.

Accuracy: ±1 count ±time base accuracy ±trigger error *.

Readout: ms and µs with positioned decimal point.

RATIO MEASUREMENT

Displays: (f_1/f_2) x period multiple *; multipliers: 1, 10, 10^2, 10^3, 10^4, 10^5.

Range, Sensitivity: f_1: 1 kHz to 2 MHz into external time base BNC connector, 1V rms min. into 1000Ω. f_2: 3 Hz to 1 MHz single period, to 2 MHz in multiple periods averaged, 10 mV rms sensitivity except 100 mV rms below 1 kHz.

Accuracy: ±1 count of f_1 ±trigger error of f_2 *.

TIME BASE

Crystal Frequency: 1 MHz.

Stability: Aging Rate: less than $\pm 1 \times 10^{-6}$/month. Temperature: less than $\pm 5 \times 10^{-6}$ from +10°C to +40°C; less than $\pm 3 \times 10^{-5}$ from 0°C to +50°C. Line Voltage: less than 1×10^{-6} for ±10% change.

Output Frequency: 1 MHz, 3V p-p min. open circuit; source impedance is 2000 ohm maximum.

External Std Input: 1 kHz to 2 MHz sine wave, 1V rms into 1000 ohm (10V rms maximum).

GENERAL

Display: 7 digits, long-life Nixies®

Display Storage, Blanking: Yes

Sample Rate: 50ms to 5s or hold until manual reset.

Reset: Manual by pushbutton or remote, activated by contact closure or saturated NPN transistor to ground on rear panel BNC connector.

Signal Input:
- Sensitivity: 10 mV rms sine wave, maximum sensitivity; 30 mV peak pulse, minimum pulse width 40 ns.
- Impedance: Approx. 1 MΩ shunted by 50 pF.
- Attenuation: Step attenuator, 0.01, 0.1, 1, 10V settings.
- Trigger Level Adjustment: Continuously variable trigger level control.
- Overload: Input voltage should not exceed 60 dB above attenuator setting or 300V rms (damage level).

Self Check: Works on all functions.

Digital Output:
- Code: 1248 "1" state positive; "0" level: 0V nominal; "1" level: +5V open circuit, nominal; source impedance: 7.5KΩ max. each line.
- Reference Levels: Ground; +5V, low impedance.
- Print Command: Step from 0V to +5V dc coupled.
- Hold-off Requirements: Voltage must be between -10V and -15V.
- Chassis Connector: Accepts HP Cable 10513A with one special connector for the 5216A and one 50-pin Amphenol or Cinch type 57-30500-375, HP Part No. 1251-0086, male connector for HP 562A 5050A or 5055A Digital Recorders.

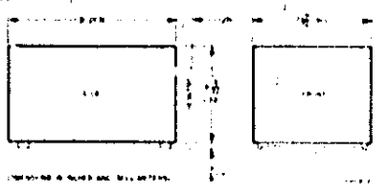
Operating Temperature Range: 0°C to +50°C.

Power Requirements: 115/230V ±10%, 50 to 400 Hz, 20W maximum.

Weight: Net 7 lbs (3,1 kg); shipping 8-1/2 lbs (3,9 kg).

Accessories Furnished: HP 10503A; 4 feet, 50Ω cable, BNC connectors. Detachable power cord, 7-1/2 feet (231 cm) long, NEMA plug.

Dimensions:



* Trigger error for 10 mV rms sine wave input is less than $\frac{\pm 0.3\% \text{ of one period}}{\text{periods averaged}}$ for signals with 40 dB signal-to-noise ratio. Decreases with increased signal amplitude and slope.

®Burroughs Corporation

SECTION II

INSTALLATION

2-1. UNPACKING AND INSPECTION

2-2. If the shipping carton is damaged, ask that the carrier's agent be present when the instrument is unpacked. Inspect the instrument for damage (dents, scratches, broken knobs, etc.). If the instrument is damaged or fails to meet specifications, (Performance Check, Paragraph 5-9), notify the carrier and the nearest Hewlett-Packard Sales and Service office immediately (offices are listed at the back of this manual). Retain the shipping carton and the padding material for the carrier's inspection. The Sales and Service office will arrange for the repair or replacement of the instrument without waiting for the claim against the carrier to be settled.

2-3. STORAGE AND SHIPMENT

2-4. To protect valuable electronic equipment during storage or shipment always use the best packing methods available. Your Hewlett-Packard Sales and Service office can provide packing material such as that used for original factory packaging. Contract packaging companies in many cities can provide dependable custom packaging on short notice. Here are two recommended packaging methods:

2-5. RUBBERIZED HAIR. Cover painted surfaces of instrument with protective wrapping paper. Pack instrument securely in strong corrugated container (350 lb/sq. in. bursting test) with 2-inch rubberized hair pads placed along all surfaces of instrument. Insert fillers between pads and container to ensure a firm fit.

2-6. EXCELSIOR. Cover painted surfaces of instrument with protective wrapping paper. Pack instrument in strong corrugated container (350 lb/sq. in. bursting test) with a layer of excelsior about 6 inches thick packed firmly against all surfaces of instrument.

2-7. ENVIRONMENT. Conditions during storage and shipment should be limited as follows:

a. Maximum temperature: +167°F (+75°C).

b. Minimum temperature: -40°F (-40°C).

2-8. RACK INSTALLATION

2-9. When instrument is to be rack-mounted, a combining case (Paragraph 2-10) or adapter frame (Paragraph 2-11) is required. These items are available through the Hewlett-Packard Sales and Service offices. The following two paragraphs outline the two methods for rack-mounting the instrument.

2-10. COMBINING CASE. The combining case (HP 1052A) shown in Figure 2-1 is a unit which accepts two instruments of 5216A size. The combining case can be used as a bench model or it can be rack mounted. A rack mounting kit (HP Part No. 5060-0777) is supplied with the combining case. Instructions for using the case are given in Figure 2-1. When only half the case is used, a blank filler panel (HP Part No. 5060-0794) is available to enclose the unused half.

2-11. ADAPTER FRAME. The adapter frame (HP Part No. 5060-0797) in Figure 2-1 is a rack frame that accepts two units of 5216 size. It can only be rack mounted. Install instruments in the adapter frame as follows:

a. Place adapter frame on edge of bench as shown in step 1 of Figure 2-1.

b. Stack units in frame as shown in step 2. Place spacer clamp between units, step 3.

c. Place two end spacer clamps (step 4) and push units into frame.

d. Insert screws on either side of frame, step 5, and tighten until units are tight in frame. The complete assembly is now ready for rack mounting.

2-12. FILLER PANELS

2-13. When only a portion of a combining case or adapter frame is used, blank filler panels are available to enclose the unused portion. Table 2-1 outlines filler panels available.

Table 2-1. Filler Panels Available

Dimensions	HP Part No.
6-3/32" high, 2-31/64" wide	5060-0795
6-3/32" high, 5-1/8" wide	5060-0793
6-3/32" high, 7-25/32" wide	5060-0794
3-1/32" high, 7-25/32" wide	5060-0097

2-14. OPERATION FROM 115 OR 230 VAC

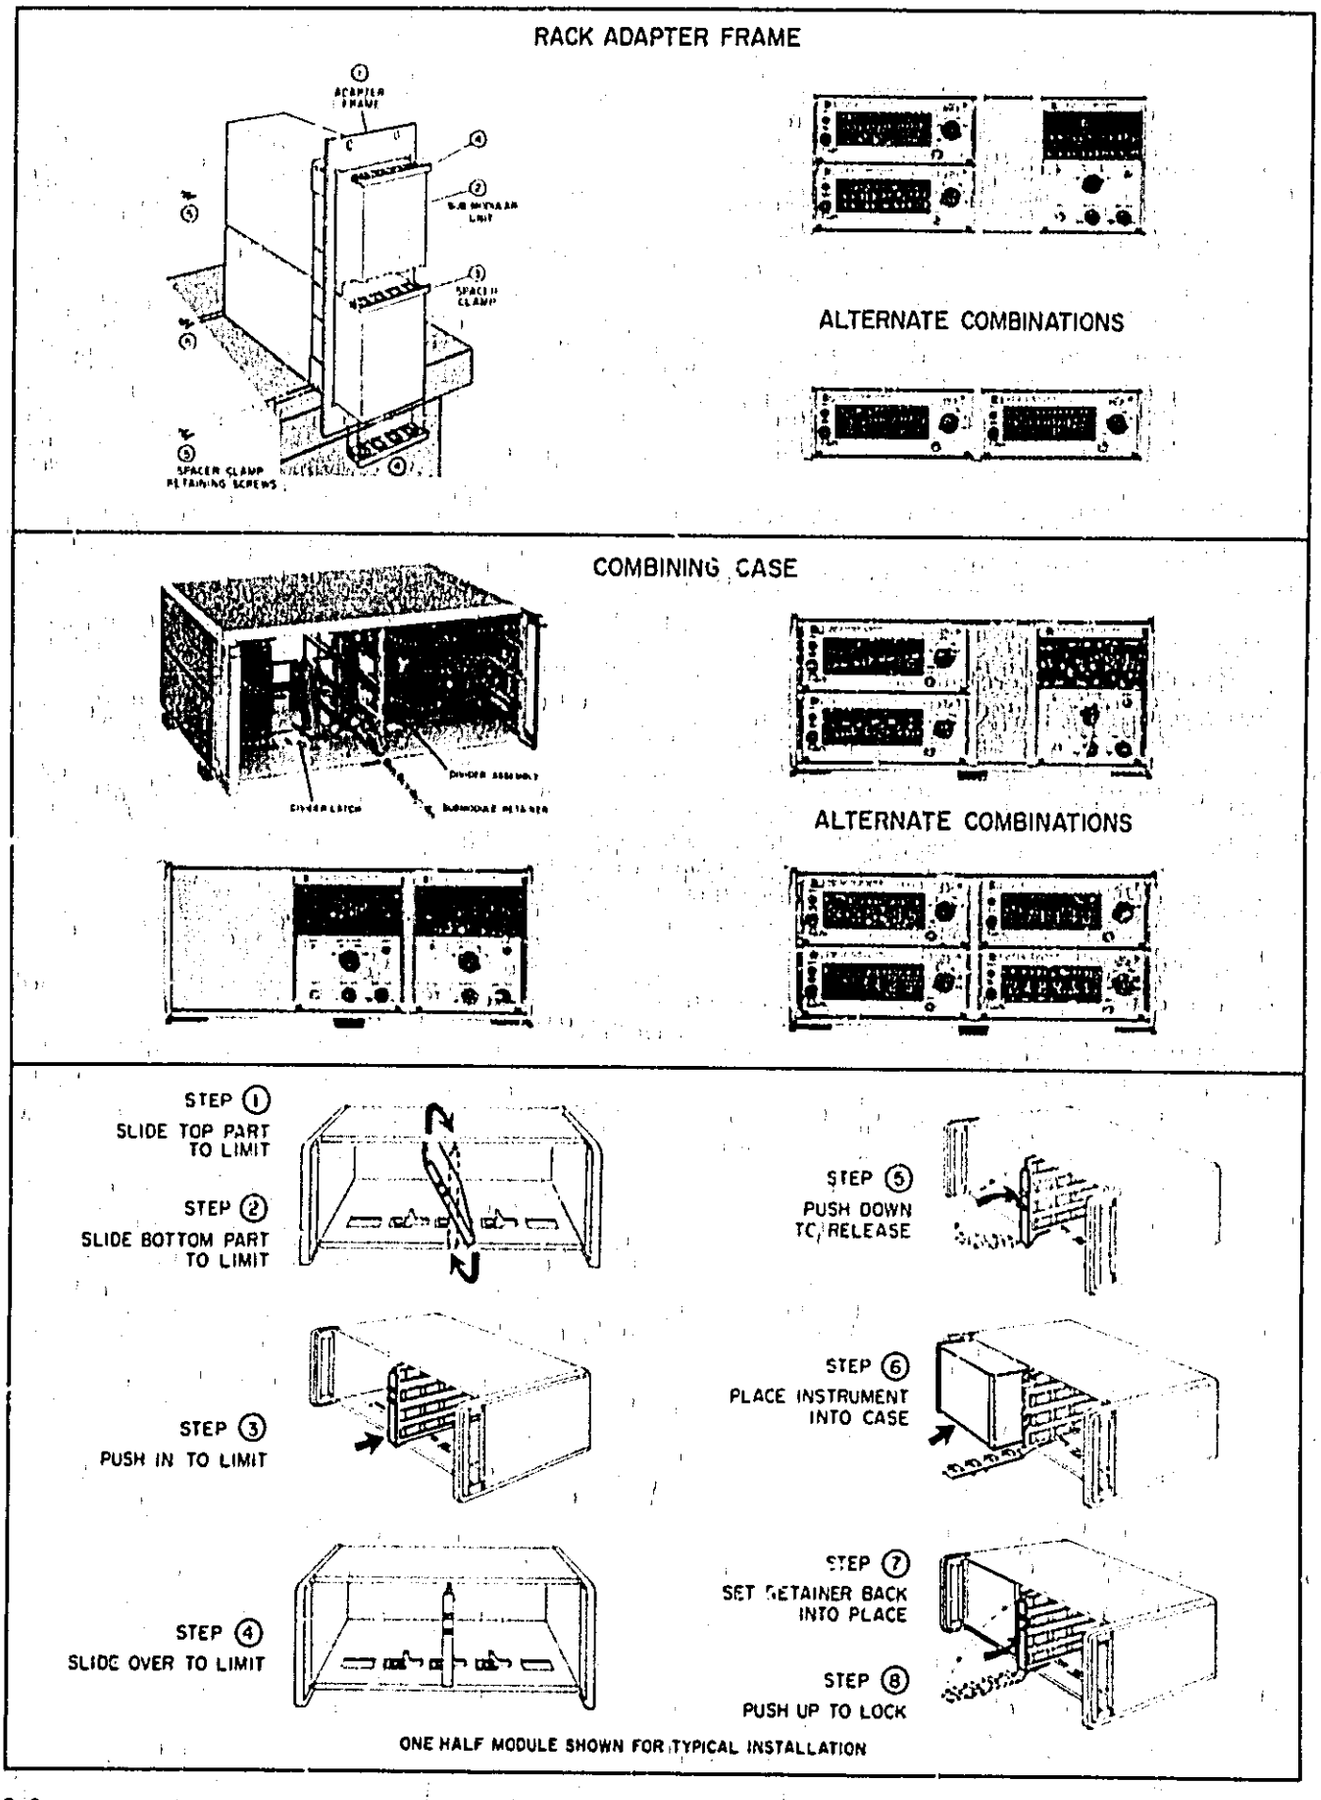
2-15. GENERAL. The instrument can be operated from either 115 or 230 Vac (±10%, 50 to 400 Hz) power lines. A rear panel slide switch permits operation from either voltage. Insert a narrow blade screwdriver in the switch slot and slide the switch to expose "115" marking for 115 volt operation or "230" marking for 230 volt operation. The ac line fuse is 0.3 for 115V and 0.15 for 230V operation.

2-16. POWER CONNECTION. The instrument is supplied with a detachable 3-wire power cable. Install as follows:

a. Connect flat plug (3-conductor female connector) to the ac line jack at the rear of the instrument.

b. Connect plug (2-blade male with round grounding pin) to 3-wire grounded ac outlet. Exposed portions of the instrument are grounded through the round pin on the plug for safety. When only a 2-blade outlet is available, use HP adapter 1251-0048 and connect short wire from side of adapter to ground.

Figure 2-1. Adapter Frame and Combining Case



OPERATION

SECTION III

OPERATION

3-1. INTRODUCTION

3-2. The HP Model 5216A measures frequency, period average, ratio of two frequencies, and total events. A switch selects both measurement functions and time base or multiplier. A SENSITIVITY switch adjusts instrument sensitivity, the SAMPLE RATE control sets the measurement cycle rate.

3-3. CONTROLS

3-4. Function Selector. This 12 position switch selects both measurement function and time base (gate time) or multiplier desired for the measurement.

3-5. SENSITIVITY Control. Adjusts instrument sensitivity. With proper settings, the counter will operate with input signals of .01 V rms (sine wave). A LEVEL control is incorporated in the SENSITIVITY switch. It provides trigger level adjustment for pulse input signals.

3-6. SAMPLE RATE Control. Sets the period of time following the gate closure until the gate may be opened again. With the counter in FREQUENCY mode, SAMPLE RATE is adjustable from approximately 0.05 sec (minimum) to at least 5 sec (maximum) and is independent of gate time. The HOLD position sets the display indefinitely.

3-7. RESET Pushbutton. When depressed, resets the display and internal count to zero. The counter after reset is ready to begin a new counting cycle.

3-8. STORAGE Switch. Disables the storage feature and controls zero blanking. The display storage feature provides a continuous visual display while the instrument is totalizing a new count. Only if the new count differs from the previous count will the display change. With storage on, a low level sets selected decades to zero at reset.

3-9. FREQ STD Switch. When this rear panel switch is set to INT, 1 MHz signal of the internal oscillator is available from the FREQ STD connector. When using an external frequency standard (or the higher of two frequencies for ratio measurement), set FREQ STD switch to EXT, and connect the external standard (or higher frequency signal) to FREQ STD connector.

3-10. FREQ-PER/TIME INT Switch. In FREQUENCY, PERIOD, or MANUAL, the switch should be in FREQ-PER position. To make time interval measurements, set switch to TIME INT. Connect start and stop control signals to START and STOP connectors on rear panel.

3-11. DIGITAL RECORDER OUTPUT

3-12. To supply counter display information to the HP Model 5050A Printer, use digital recorder interconnecting cable HP Part No. 10513A. The DIGITAL RECORDER jack will mate with 36-pin printed circuit connector A4J1 on the counter rear panel. Signals available and external signals required are given in Table 3-1. BCD output code is 1248, "1" state positive.

Table 3-1. Digital Recorder Jack Pin Connections

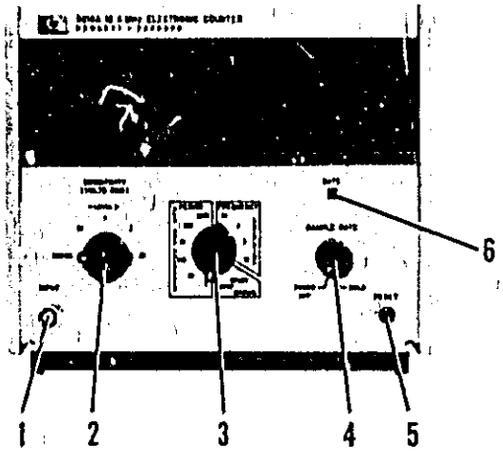
+5Volts positive reference, indicates "1" level for BCD output.		3
Ground		1

Figure 3-1. Front Panel Controls and Connector



1. INPUT jack couples input signal to input attenuator.

2. SENSITIVITY

   a. Connects CHECK signal or attenuated input signal to input amplifier.

   b. LEVEL control adjusts input trigger level.

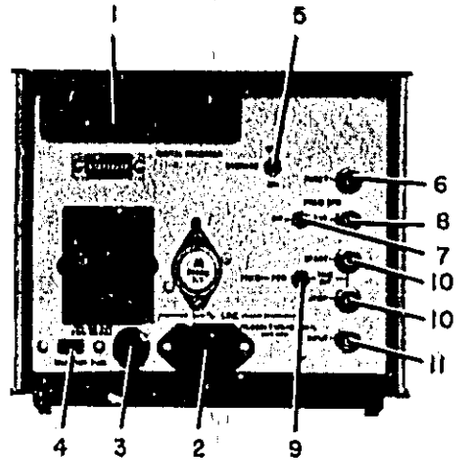
3. Function - Time Base switch - selects multiplier for PERIODS AVERAGED measurements, selects gate times for FREQUENCY measurements, and controls START and STOP for totalizing measurements.

4. SAMPLE RATE control turns counter on, holds display, and varies sample rate from 50 ms to 5 seconds.

5. RESET switch manually resets counter.

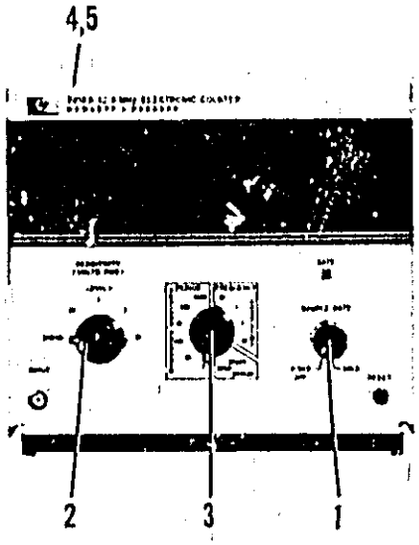
6. GATE light indicates gate open when light is on.

Figure 3-2. Rear Panel Controls and Connectors



1. DIGITAL RECORDER jack supplies BCD information to printer (see page 3-1).
2. AC LINE connector connects to flat plug on power cable.
3. Fuse provides overload protection.
4. Line Voltage switch selects either 115 or 230 Vac line; insert narrow blade and slide to right for 115V, slide to left for 230V.
5. STORAGE switch disables storage feature and controls zero blanking.
6. RESET jack provides remote reset of counter by contact closure to ground.
7. FREQ STD switch selects internal oscillator or external frequency standard.
8. FREQ STD jack provides 1 MHz output when internal oscillator is used; is input jack for 1 MHz external frequency standard.
9. FREQ-PER/TIME INT switch selects type of measurement, FREQ-PER or TIME INT.
10. START and STOP jacks control signal inputs for time interval measurements.
11. INPUT jack connected in parallel with front panel input jack.

Figure 3-3. Self Check

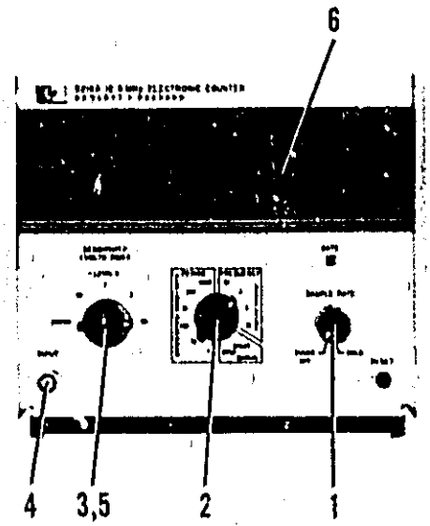


1. Set SAMPLE RATE control slightly clockwise out of POWER OFF.
2. Set SENSITIVITY switch to CHECK.
3. Set function selector to 1 PERIOD.
4. Set STORAGE switch to STORAGE.
5. Set FREQ STD switch to INT.
6. Adjust LEVEL control for stable count.

Position	Display
1 period	.001 ms
10 periods	.0010 ms
100 periods	.00100 ms
1K periods	1.000 μs
10K periods	1.0000 μs
100K periods	1.00000 μs
0.01 sec	1.0000 MHz
0.1 sec	1.00000 MHz
1 sec	1000.000 kHz
10 sec	000.0000 kHz

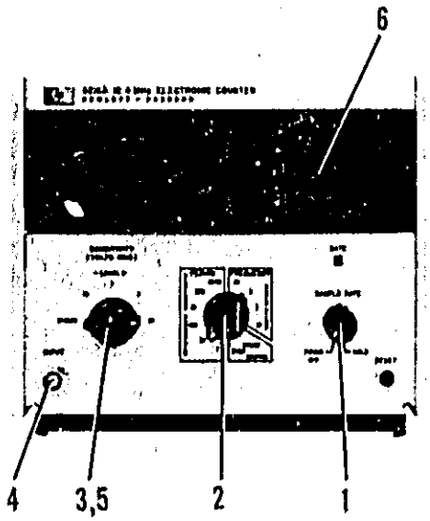
MANUAL START = continuous count at 1 μs rate
MANUAL STOP = continuous display of last count

Figure 3-4. Frequency Measurements



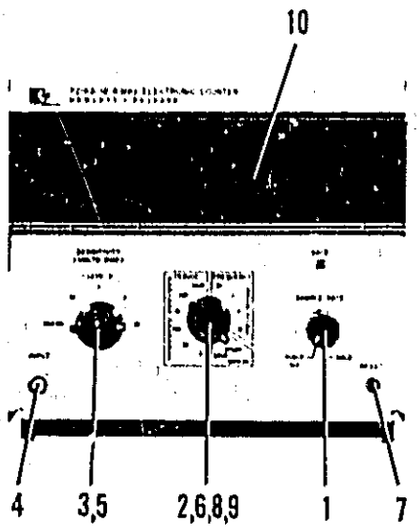
1. Turn SAMPLE RATE control clockwise from POWER OFF position to turn counter on.
2. Set function switch to desired FREQUENCY GATE TIME.
3. Set SENSITIVITY switch to CHECK to verify proper counter operation.
4. Connect unknown signal to the INPUT jack.
5. Change SENSITIVITY switch to 10; if there is no count or if count is uncertain, progressively set SENSITIVITY switch to lower ranges. Adjust -LEVEL+ control, if necessary, for proper triggering.
6. Read frequency from display. Decimal point is correctly positioned and correct measurement unit (kHz or MHz) is displayed.

Figure 3-5. Period Measurements



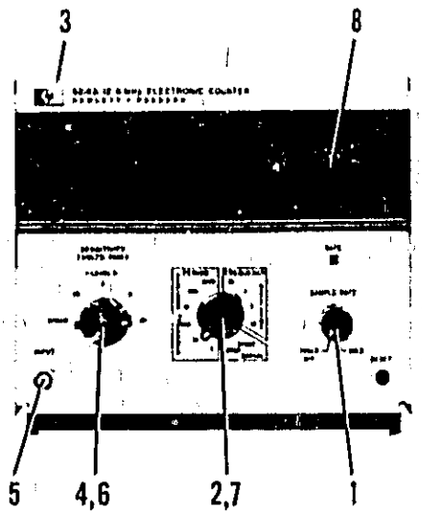
1. Turn counter on with SAMPLE RATE control.
2. Set function switch to desired PERIODS AVERAGED.
3. Set SENSITIVITY switch to CHECK to verify proper counter operation.
4. Connect unknown signal to the INPUT jack.
5. Turn SENSITIVITY switch clockwise to first position which gives steady count. Adjust -LEVEL+ control for proper triggering.
6. Read period from display; decimal point is correctly positioned and measurement unit (μs or ms) is displayed.

Figure 3-6. Totalizing Operation



1. Turn counter on with SAMPLE RATE control.
2. Set function switch to MANUAL START.
3. Set SENSITIVITY switch to CHECK to verify proper counter operation. Counter should count continuously at 1 μs rate.
4. Connect unknown signal to INPUT jack.
5. Change SENSITIVITY switch to 10; if there is no count or if uncertain, switch to lower ranges. Adjust -LEVEL- control for proper triggering.
6. Set function switch to MANUAL STOP.
7. Reset count to zero.
8. At desired time to begin count, set function switch to MANUAL START.
9. At desired time to end count, set function switch to MANUAL STOP.
10. Read accumulated count from display.

Figure 3-7. Ratio Measurements



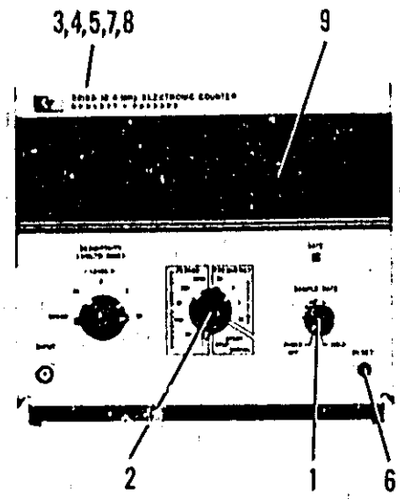
Proceed as follows to measure the ratio between two frequencies (f_1/f_2):

Higher frequency f_1 may be between 1 kHz and 10 MHz.

Lower frequency f_2 must be less than 1 MHz for single period and less than 2 MHz for multiple period measurements.

1. Turn counter on with SAMPLE RATE control.
2. Set function switch to desired PERIODS AVERAGED.
3. Connect higher frequency f_1 to FREQ STD connector on rear panel and set FREQ STD switch to EXT.
4. Set SENSITIVITY switch to 10V rms position.
5. Connect lower frequency f_2 to INPUT connector.
6. Turn SENSITIVITY switch clockwise until stable count is displayed. Adjust -LEVEL- control for proper triggering.
7. Set function selector to PERIODS AVERAGED multiplier which gives the desired resolution.
8. Divide display by period multiplier to obtain f_1/f_2. Disregard decimal point and measurement units.

Figure 3-8. Time Interval Measurements



1. Turn counter on with SAMPLE RATE control.
2. Set function switch to 1 PERIODS AVERAGED.
3. Set FREQ-PER/TIME INT switch to TIME INT.
4. Connect start and stop control signals to START and STOP jacks.
5. Trigger stop signal.
6. Reset counter.
7. Trigger start signal.
8. Trigger stop signal.
9. Read time interval from display.

NOTE

In the 1 PERIODS AVERAGED function, decimal point and measurement unit is correct.

THEORY

SECTION IV

THEORY OF OPERATION

4-1. INTRODUCTION

4-2. The Electronic Counter measures frequencies between 3 Hz and 12.5 MHz with seven digit display. In addition, time interval, period, and ratio measurements can be made. An internal 1 MHz time base frequency is standard and provides the clock signal for counting. Four line BCD code is supplied with assigned weights of 1, 2, 4, 8 and "1" or high level positive with respect to the "0" or low level. This BCD code is available at the rear panel for use with a digital recorder. The self check operation mode permits counting the internal time base signal to insure that the decade counters, gates, function selector switch, input amplifier, and time base are operating.

4-3. BLANKING

4-4. The blanking feature suppresses the display of insignificant zeros in the display. Blanking can be manually disabled with the rear panel storage switch off. This simultaneously disables the storage of input data. Thus, with no blanking or storage, the digital display will continuously change while the new count is being totalized.

4-5. GATING AND LOGIC

4-6. The counter circuits make extensive use of integrated circuits. As a result, it is necessary to understand basic logic symbols and their application in gating. In the circuit diagrams, AND gate and OR gate symbols are used extensively. The following paragraphs and illustrations introduce logic symbols and their applications.

4-7. Logic Symbols

4-8. The symbol shown in Figure 4-1A is for the basic AND function. The basic AND gate output is high if all inputs are high. The AND gate can have two or more inputs. The symbol in Figure 4-1D is for the basic OR gate. The basic OR gate output is high when one or more of its inputs is high. The OR gate can also have two or more inputs. A small circle at the input line of a logic symbol indicates a low (L) level activates the function. The symbol of Figure 4-1B shows a low input on all lines causes a high (H) output. A small circle at the output line of a logic symbol indicates a low (L) level when activated, as shown in Figure 4-1C. Thus, the small circle indicates inversion. This applies to both types of gates. Figure 4-2

Figure 4-1. Gate Symbols

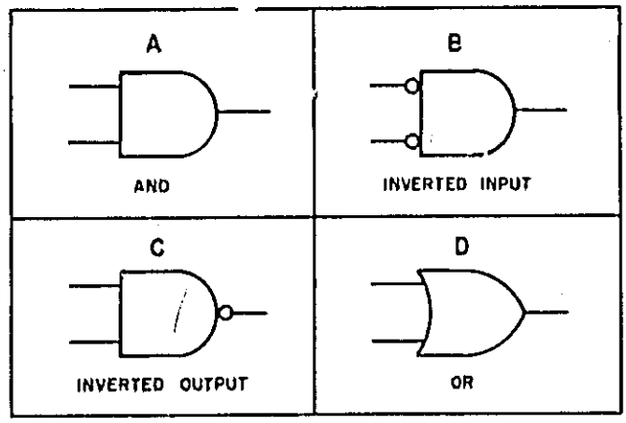


Figure 4-2. Logic Function Comparison

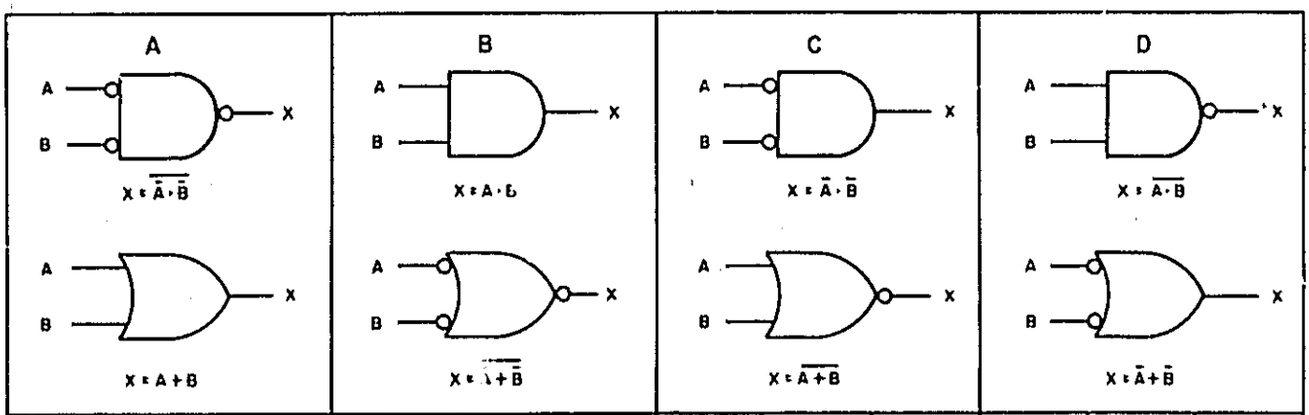

A	B	X	A	B	X	A	B	X	A	B	X
H	H	H	H	H	H	H	H	L	H	H	L
H	L	H	H	L	L	H	L	L	H	L	H
L	H	H	L	H	L	L	H	L	L	H	H
L	L	L	L	L	L	L	L	H	L	L	H

lists examples and truth tables for logic actions. When the output of the OR gate is inverted, it is referred to as a NOR gate. Similarly, an inverted AND gate output gives a NAND gate.

4-9. Two states exist in the binary system, high (H) and low (L). H is more positive than L. In positive logic the one state is more positive than the zero state. In negative logic the one state is less positive than the zero state. In positive or negative logic H always represents the more positive level. In this manual, positive logic is used.

4-10. Multiple Input JK Flip-Flop

4-11. Figure 4-3 illustrates the specific JK flip-flop used for main flip-flop A4IC7. The distinguishing features of this JK flip-flop are the multiple input gates at the J and K inputs.

4-12. JK Master-Slave Flip-Flop

4-13. The JK master-slave flip-flop is a bistable MV. A unique feature is that with a simultaneous high input to J and K, before the clock pulse, Q and $\overline{Q}$ will change states after the clock pulse. Refer to Figure 4-4 and Table 4-1. The JK master-slave flip-flop triggers on the trailing edge of the clock pulse. The preset (P) and clear (C) inputs operate as follows: If a low is applied to the preset input, $\overline{Q}$ will go low. If a low is applied to the clear input, Q will go low. In the JK master-slave flip-flop, either preset or clear can override all other inputs at any time.

Figure 4-3. Multiple Input JK Flip-Flop

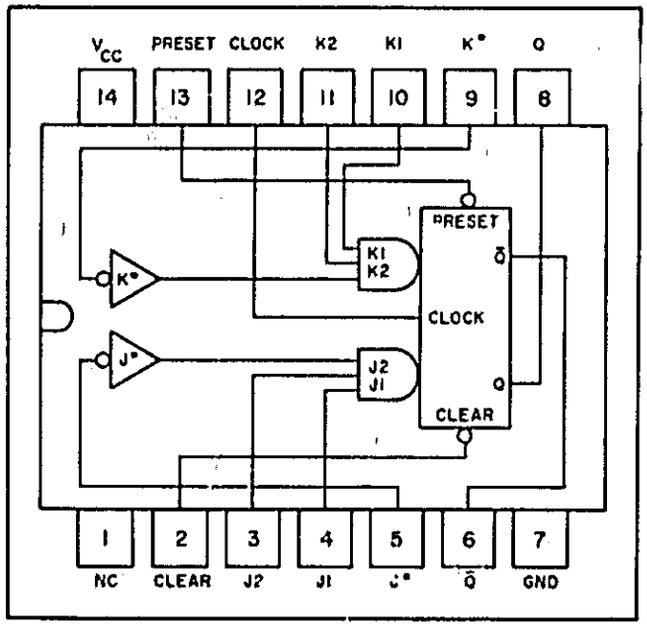

Figure 4-4. JK Flip-Flop

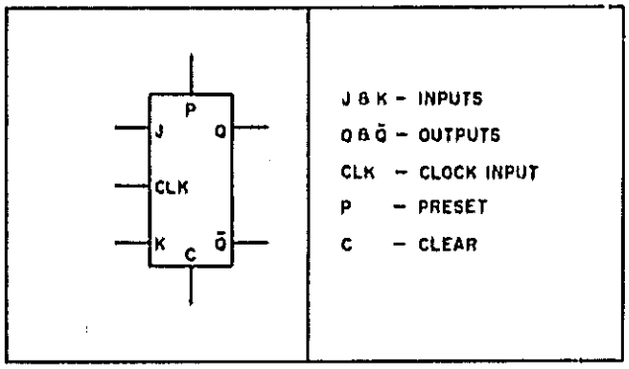

Table 4-1. Truth Table

t_n		$t_n + 1$		t_n = before clock pulse $t_n + 1$ = after clock pulse
J	K	Q	$\overline{Q}$	
0	0	Q_n	$\overline{Q}_n$	If J = 0 and K = 0, then Q and $\overline{Q}$ will not change from what they were before the clock pulse.
1	0	1	0	If J = 1 and K = 0, then Q will be a 1 and $\overline{Q}$ a 0 after clock pulse.
0	1	0	1	If J = 0 and K = 1, then Q will be a 0 and $\overline{Q}$ a 1 after a clock pulse.
1	1	$\overline{Q}_n$	Q_n	If J = 1 and K = 1 before clock, then after clock pulse Q and $\overline{Q}$ will change states.

4-14. INPUT ATTENUATOR ASSEMBLY A1
Schematic Diagram Figure 8-7

4-15. Input Attenuator A1 includes SENSITIVITY switch S1 and associated mounted components in a shielded compartment. The -LEVEL+ control A1R10 is mounted on the rear of the shield. In CHECK, 1 MHz from main board assembly A4 goes through S1 to input amplifier assembly A2. In 10, 1, and .1 positions, resistive dividers with capacitive compensation are switched in to attenuate the input signal. In .01, the input signal is applied straight through to A2.

4-16. INPUT AMPLIFIER ASSEMBLY A2
Schematic Diagram Figure 8-8

4-17. Input Amplifier A2 provides about 33 dB gain, A2 output drives the shaping amplifier in next assembly A4. Source follower Q1, Q2 uses field effect transistor Q1 and feedback amplifier Q2 for isolation. Voltage gain of the stage is unity. Diodes CR1 and CR2 are limiters. Q3, Q4 and Q5, Q6 provide two stages of amplification to drive trigger Q7, Q8. This trigger drives pulse amplifier Q9, Q10. The pulse amplifier output then goes to next assembly A4. Q11, with A1R1, adjusts bias level for the trigger circuit.

4-18. 1 MHz OSCILLATOR ASSEMBLY A3
Schematic Diagram Figure 8-9

4-19. A3 1 MHz oscillator contains oscillator Q1, buffer amplifier Q2, and associated components.

4-20. MAIN BOARD ASSEMBLY A4
Schematic Diagram Figure 8-10

4-21. Main board assembly A4 is shown on three pages in the schematic of this manual. Flow diagrams at the back of this manual show the signal path through the main board circuits for operation in the frequency, period, ratio, and time interval modes. On these flow diagras the input signal is a heavy line while the time base signal is a dashed line.

4-22. A4 MAIN BOARD

4-23. INPUT CIRCUIT. The Counter INPUT signal, after processing by the input attenuator (A1) and amplifier (A2), is connected to the main board (A4) through A4J2(3) to shaping amplifier Q4. The Q4 collector output is connected to two inputs, pins 1 and 4 of IC5, the function control selector.

4-24. BUFFER AND SCHMITT TRIGGER. The internal time base signal at A4J2(11) is amplified and isolated by A4Q1 and the output of Q1 is applied to IC6C(1). From Q1 the 1 MHz signal is also supplied to J4 for external use and to A1 for use as a CHECK signal. In the EXT FREQ STD mode the external time base signal is applied through J4 and A4J2(H) to a Schmitt trigger composed of A4Q2, Q3, and Q5. The Schmitt trigger output is applied to IC6C(2).

4-25. SIGNAL-TO-BE COUNTED SELECTOR. The gate formed by IC5A-B-C controls which signal is counted. When IC5A(5) is enabled by a high (FREQUENCY mode) the pulses at IC5A(4) (which are derived from the counter input signal through A2 and A4Q4) are steered through IC5A and B to the main gate for counting. When IC5C(3) is enabled by a high (PERIOD mode) the time base signal at IC5C(2) (from A3 through A4Q1, Q2, Q3, Q5, and IC6C) is steered through IC5C and IC5B to the main gate to be counted.

4-26. MAIN GATE CONTROL SELECTOR. The gate formed by IC5D-E-F selects the signal which will control the Main Gate. When IC5D(13) is enabled by a high (PERIOD mode), the pulses at IC5D(1), which are derived from the counter input signal, are steered through IC5D and E to decade divider IC3A. In "1 PERIOD" mode the output of IC5E(8) are directly through IC5D and B to the main gate control flip-flop, IC7(12), as the CLOCK signal. When IC5F(9) is enabled by a high (FREQUENCY mode) the 10 kHz (or external frequency standard divided by 10) from IC4A(13) is steered through IC5F and E to decade divider IC3A(2) input.

4-27. DECADE DIVIDERS (IC3, IC2, and IC1). The output of main gate control selector, IC5E(8) is applied to the input, IC3A(2), of the decade divider string (IC3A, IC3B, IC2A, IC2B, and IC1A). Each IC section of the decade divider string divides its pin 2 or 10 input signal by 10, and supplies the 10 output at pin 4 or 12 to the next divider. A gated output is at pin 13 or 5. The gate control (enabled by a ground) is applied to pin 14 or 6. The function-range switch S2 selects which decade divider gated output is enabled and applied through IC6B to the main gate flip-flop, IC7(12).

4-28. SAMPLE RATE Flip-Flop (IC9A). This is a master-slave flip-flop. With the J input connected to +5.1 V (high) and the K input connected to ground (low) if a negative edge is applied to the CLK (clock) input, the flip-flop will set (Q=1). A low applied to the CLR (clear) will make Q=0 regardless of the J and K input levels.

4-29. RESET Flip-Flop (IC9B). The reset flip-flop is the same type as the sample rate flip-flop.

4-30. COUNTER MAIN GATE LOGIC. When the main gate flip-flop (IC7) is cleared (reset) IC7$\overline{Q}$ is high and Q is low. The high from IC7$\overline{Q}$ closes the main gate (Q14-Q13), Q14 is on. The low from IC7Q output is connected to IC7$\overline{J}$ and the low is inverted to high. Both IC7J1 and J2 are high because IC9A and IC9B are cleared, making both $\overline{Q}$ outputs high. With IC7J high and IC7K low (the Q output low is connected to K1 input which makes the K low), a positive transition at the CLK input will set the main gate flip-flop. Then IC7Q will be high and $\overline{Q}$ will be low. With $\overline{Q}$ low Q14 is switched off (the main gate is open).

4-31. A pulse signal to Q13 base can switch Q13 off producing a positive pulse at the Q14-Q13 collectors. This is the pulse to be counted. When the main gate flip-flop is set, as described in the preceding paragraph, IC7Q is high and $\overline{Q}$ is low. The IC7 output is connected to IC7$\overline{J}$ and K1. This makes IC7J low and K input high, which allows the main gate flip-flop to be reset by the next CLK pulse, closing the main gate.

4-32. The main gate flip-flop Q output is connected to the CLK input of the sample rate flip-flop, IC9A. The sample rate flip-flop will set when the CLK input goes from high to low. When set, the sample rate flip-flop Q output goes high and $\overline{Q}$ goes low. The sample rate flip-flop $\overline{Q}$ output is connected to the J1 input of the main gate. So with the sample rate flip-flop set there is a low at both J gate and K gate inputs of the main gate flip-flop. This disables the main gate flip-flop while the sample rate flip-flop is set.

4-33. The sample rate flip-flop Q output high goes through R29, R28, and the SAMPLE RATE control (R1) to C7 and the base of Q9. Capacitor C7 starts charging at a rate determined by R29, R28, and the setting of the SAMPLE RATE control. At some time during the charging of C7, Q9 and Q10 switch on which switches IC6A on and IC6A(6) goes low at the CLK input of IC9B, the reset flip-flop. This negative transition clocks the reset flip-flop and since J is tied high and K is tied low the flip-flop is set; Q goes high and $\overline{Q}$ goes low. The reset flip-flop $\overline{Q}$ output is connected to the J2 input of the main gate flip-flop. The reset flip-flop $\overline{Q}$ output is also connected to the CLR (clear) input of

the sample rate flip-flop which is cleared by the low. The sample rate flip-flop Q output goes low forward biasing CR15 and allowing C7 to discharge through R29. When the reset flip-flop is set, the high at the Q output charges C8 through R30 and eventually switches Q8 on which applies a high to IC8C(5). The IC8(5) high is inverted at IC8C(6) and this low is applied to the reset flip-flop CLR input which clears the reset flip-flop. With the reset flip-flop cleared its $\overline{Q}$ output goes high and this high is applied to the J2 input of the main gate flip-flop. The J1 input of the main gate flip-flop is high since the sample rate flip-flop is cleared with its $\overline{Q}$ output high. With the main gate flip-flop J input high and K input low the main gate flip-flop is ready to be clocked by the next pulse from IC6B(8).

4-34. ONE-SHOT AND DRIVER (A4Q12 and Q4Q11). If less than a full pulse is received by Q12 from the main gate, Q14-Q13, the one-shot will either produce a standard width and amplitude pulse to Q11 or no pulse at all. This eliminates triggering on less than a full pulse.

4-35. The main gate signal from R42 goes to decade counter IC30 pin 9. BCD information from the first decade goes to buffer storage unit IC23 and also to next decade, IC29 pin 9. The buffer storage unit BCD information is taken off for a digital recorder from printed circuit connections on main board assembly jack A4J1. This is 1248 BCD code with "1" state positive. BCD information from the buffer storage unit goes to a decoder driver which has a 1248 "1" state negative input. The decoder unit then drives digital display tube DS7. The process is repeated in the other stages of counting, storage, and display.

4-36. POSITIVE RESET SIGNAL. When the reset flip-flop is set, the $\overline{Q}$ output is low and IC8E inverts the low for the positive reset signal.

The positive reset signal resets the decade dividers IC1, IC2, IC3, and the decade counters IC24 to IC30.

4-37. PRINT COMMAND. The print command from Q15 collector is high during display time.

4-38. GATE LIGHT AMPLIFIER. The gate light amplifier, Q16, is switched by the main gate flip-flop $\overline{Q}$ output. The gate light is on when Q16 is off. The R45 and C12 circuit stretches short pulses to insure flashing the gate light for short gate times.

4-39. TIME INTERVAL START-STOP. In the START mode the main gate is held open continuously by the low applied to the PRE (preset) input of IC7. While the main gate is open the counter input signal is being counted as pulses and displayed. When the function switch is moved to STOP the main gate is closed and the total of the signals counted while the gate was open is displayed. Both START and STOP functions can be remotely controlled through back panel connectors.

4-40. BUFFER STORAGE TRANSFER SIGNAL. At the end of the gate time the IC9AQ output goes from high to low and this signal is coupled through R23 and C6 to the base of Q7 which is momentarily switched off and the Q7 collector (and IC8D(9)) goes high. The output of IC8D goes low, which is the transfer signal to the buffer storage units. If the STORAGE switch is OFF the output of IC8D is continuously low which is the buffer storage units.

4-41. DECADE DIVIDERS. Decade dividers IC1 through IC4 are 1248 code dividers which divide by 10. The input is at pin 2 or 10 and the output is at pin 4 or 12. IC3, 2, and 1 have gated outputs from pin 5 or 13. IC4 has pin 14 or 6 permanently forced low; thus, the output is from pin 6 at all times.

4-42. DECADE COUNTERS. Decade counter IC30 is a high-speed, blanking decade. Input is on pin 9 and the output is from pin 8. It provides a negative 1248 BCD code to buffer storage unit IC23. Decade counters IC24, IC25, IC26, IC27, IC28, and IC29 are low frequency blanking type decades. Blanking occurs when the storage switch is on and a low is applied to pin 10 of IC24, IC25, IC26, and IC27. IC26 and IC27 blanking may be over-ridden by a high to pin 10 controlled by function switch S2E. The 1248 BCD code drives the buffer storage units.

4-43. BUFFER STORAGE UNITS. These units have 4 inputs and 8 outputs. Four outputs are in phase with the input while the other 4 are not. When a low transfer pulse is applied to pin 5, the outputs assume the state of the input. When the low is removed, the outputs remain in their last state until a neutral transfer pulse is applied.

4-44. DECODER DRIVER UNITS. Decoder drivers are BCD-to-decimal decoders with 4 inputs and 10 outputs. A low from the decoder driver to a number in the digital display tube will light that number.

4-45. DECIMAL POINT AND MEASUREMENT UNITS ASSEMBLY A5

Schematic Diagram Figure 8-9

4-46. Neon lamps DS1 through DS3 are decimal point lights. Neon lamps DS4 through DS7 are the measurement unit lights. All are controlled by function switch S2 on the front panel.

4-47. POWER SUPPLY ASSEMBLY A6

Schematic Diagram Figure 8-11

4-48. GENERAL. Four regulated voltage sources of +175, +5, -5.8, and +5.1 volts are on power supply assembly A6. These are the operating voltages for the instrument. In the following discussion, complete reference designations are used to identify components. This is to prevent confusion between identifying components on the chassis and components on power supply assembly A6.

4-49. PRIMARY POWER. Either 115 Vac or 230 Vac is connected through fuse F1 and power switch S1. Slide switch S4 on the rear panel connects T1 primary

windings in parallel for 115 Vac operation or in series for 230 Vac operation.

4-50. +175 VOLT SUPPLY. The +175 volt supply includes full wave rectifier diodes A6CR1 through A6CR4. Series regulator A6Q1 is controlled by variations of the output voltage compared to the zener-controlled A6Q1 base voltage. A6Q4 limits the output current.

4-51. +5/-5.8 VOLT SUPPLY. This supply consists of a full wave rectifier filtered by A6C3. A regulated 12 volts is set by A6CR16, A6CR15, and A6Q2; a center ground is set by A6Q7 and A6R9. A6Q3 regulates the total voltage by controlling the current.

4-52. +5.1 VOLT SUPPLY. This supply consists of full wave rectifier diodes A6CR9 through A6CR12 with filtering by A6C2, A6C5. Series regulator Q1 is driven by A6Q5. Voltage level is controlled by reference amplifier A6Q6 with bias set by A6R10. Thermistor A6RT1 compensates for changes in current. Further filtering is by A6C6 and A6C7.

MAINTENANCE

SECTION V

MAINTENANCE

5-1. INTRODUCTION

5-2. This section provides maintenance and service information for the Model 5216A. Included are: table of recommended test equipment; in-cabinet performance check; troubleshooting procedures; plus repair and adjustment procedures.

5-3. ASSEMBLY DESIGNATIONS

5-4. Table 5-1 lists the designation, name, and part number of assemblies used in the instrument.

5-5. TEST EQUIPMENT

5-6. Recommended test equipment for troubleshooting and performance checking is listed in Table 5-2.

Table 5-1. Assembly Identification

Assy	Name	HP Part No.
A1	Input Attenuator	05216-6005
A2	Input Amplifier	05216-6003
A3	1 MHz Oscillator	05216-6010
A4	Main Board	05216-6013
A5	Decimal Point and Measurement Unit	05216-6004
A6	Power Supply	05216-6012
W1	Cable, Gate Light	05216-6014

5-7. INSTRUMENT COVER REMOVAL

5-8. To remove top cover, take out two screws securing the rear of top cover to main chassis. Slide cover to rear about 1/4 inch, then lift rear of cover. To remove bottom cover, first set tilt bail at right angle with bottom cover. Then take out two screws securing the rear of cover to the main chassis. Remove rear plastic foot according to directions on foot. Slide cover to rear and remove. To install cover, reverse procedure.

WARNING

115/230V ac and dc supply wires are exposed when either cover is removed. Exercise extreme caution during troubleshooting, adjustment, or repair. Disconnect ac power from instrument before removing or replacing covers or assemblies.

5-9. IN-CABINET PERFORMANCE CHECK

5-10. The in-cabinet performance check outlined in Table 5-3 lists checks to verify specifications. The Performance Check Test Record page can be filled out during the checks to provide a permanent record of performance of each instrument. The in-cabinet performance checks can be used:

a. As part of an incoming inspection check of instrument specifications;

b. Periodically, for instrument used in systems where maximum reliability is of utmost importance;

Table 5-2. Recommended Test Equipment

INSTRUMENT	CHARACTERISTICS	RECOMMENDED TYPE
Low Frequency Oscillator	Range: 1 Hz to 100 kHz Output: 10 mV to 1 V rms	HP Model 202C
Signal Generator	Range: 50 kHz to 12.5 MHz Output: 10 mV to 3 V rms	HP Model 606B
Oscilloscope	Bandwidth: dc to 12.5 MHz Sensitivity: 10 mV to 10 V	HP Model 175A with 1755A and 1780A plug-ins
DC Voltmeter	Range: 0 to 155 V dc Accuracy: ±1% of full scale Input impedance: 100 megohms	HP Model 412A
Frequency Standard	Frequency: 1 MHz Level: 1 V rms	HP Model 107AK
Preset Counter	Output: positive or negative pulses (use inverter with positive pulses), variable time between pulses	HP Model 5214L
Power Supply	Range: +5 V, -15 V at 5 ma	HP Model 721A

c. As part of a troubleshooting procedure to locate troublesome circuits, and

d. After any repairs or adjustments, before returning instrument to regular service.

5-11. TROUBLESHOOTING

5-12. General

5-13. Trouble isolation can best be accomplished by first obtaining all possible information from the controls, indicators, and connectors; then logically applying this information to locate the defective circuit or component. Operating procedures in Section III and circuit diagrams in Section VIII can be used to help understand operation. Table 5-1 lists the printed circuit assemblies in the instrument. Figure 5-2 shows the location of assemblies and chassis-mounted components in the instrument. Refer to component location figures, voltages, and waveforms with the schematic diagrams in Section VIII. The performance check (Table 5-3) and troubleshooting tables 5-4 and 5-5 are also useful for locating trouble.

5-14. Removal of Main Board Assembly A4

5-15. To remove main board assembly A4:

a. Remove the top and both side covers (see Paragraph 5-7).

b. Remove front panel window by sliding it out either side.

c. Reach inside the side castings and gently lift sides of main board. Pull the board forward with the fingers.

d. After board is started, remove connector XA4.

e. Push or pull board out of counter being careful to keep board moving in a straight line.

f. To replace board, reverse the above procedure.

Make sure connector XA4 is reconnected and none of the wires are pinched by the board.

Table 5-3. In-Cabinet Performance Check

FREQUENCY MEASUREMENTS

1. RANGE: 3 Hz to 12.5 MHz

   a. Set Counter controls as follows:

SENSITIVITY	.01 V
- LEVEL + ...	adjust for stable count
Function Switch	FREQUENCY, 1 sec
SAMPLE RATE	ccw out of POWER OFF

   b. Connect Low Frequency Oscillator to Counter and Oscilloscope with BNC "T" connector (Oscilloscope is used to monitor input signal level).

   c. Vary frequency from 3 Hz to 50 kHz, keeping signal level constant at 0.01 V rms (0.028 V peak-to-peak).

   d. Substitute Signal Generator for Low Frequency Oscillator and set Counter function switch to .1 sec.

   e. Vary frequency from 50 kHz to 12.5 MHz at 0.01 V rms (0.028 V peak-to-peak). Record results on test card.

2. SENSITIVITY: 0.01 V rms sine wave, 3 Hz to 12.5 MHz. Sensitivity checked by Procedure 1, Range Check.

3. GATE TIMES: 10, 1, .1, .01 seconds

   a. Set Counter controls as follows:

SAMPLE RATE	ccw out of POWER OFF
SENSITIVITY	.01 V
- LEVEL + ...	adjust for stable count
Function Switch	FREQUENCY .01 sec

   b. Connect Signal Generator to INPUT jack. Set Signal Generator output to 10 MHz at 0.01 V rms.

   c. Rotate function switch to each gate time and observe counter display for each setting. Record.

Table 5-3. In-Cabinet Performance Check Cont'd.

FREQUENCY MEASUREMENTS Cont'd.

4. READOUT: 7 significant digits with decimal point positioning and measurement unit display (kHz or MHz).

   CHECK: counts 1 MHz for the GATE TIME selected by the function switch.

   a. Use Self Check procedure, Figure 3-3, Page 3-4.

   b. Record results on test card.

TIME INTERVAL MEASUREMENTS

RANGE: 10 μs to 10 s

a. Connect test setup shown in Figure 5-1 and set 5216A controls as follows:

SAMPLE RATE	ccw out of POWER OFF
SENSITIVITY	not CHECK
- LEVEL +	adjust for stable count
Function switch	1 PERIOD AVERAGE
FREQ-PER TIME INT	TIME INT

b. Set 5214L controls as follows:

SENSITIVITY	CHECK
FUNCTION	TIME
MULTIPLIER	X1
SAMPLE RATE	ccw out of POWER OFF
"N" switches	00100

c. Reset both counters.

d. "N" switches may be set at any number desired.

e. Display should be the same on both counters. Record results on test card.

Figure 5-1. Test Setup for Time Interval Checks

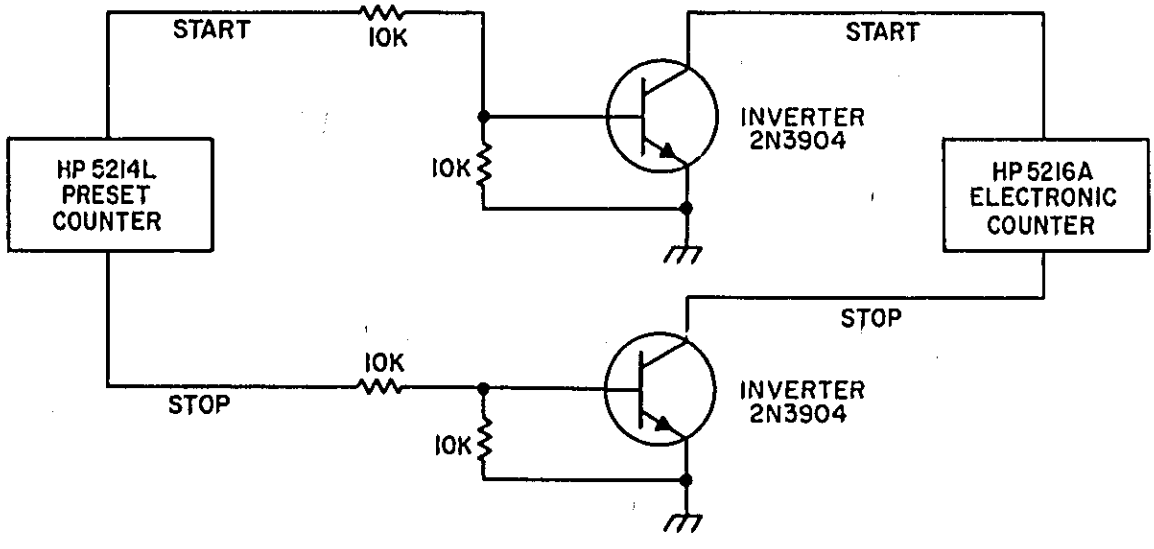

Table 5-3. In-Cabinet Performance Check Cont'd.

PERIOD MEASUREMENTS

1. FREQUENCY RANGE SINGLE PERIOD: 3 Hz to 1 MHz

   a. Set Counter controls as follows:

SENSITIVITY	.01 V
- LEVEL + ...	adjust for stable count
Function switch	1 PERIOD AVERAGE
SAMPLE RATE	cw out of POWER OFF

   b. Connect Signal Generator to Counter.

   c. Set Signal Generator output to 1 MHz at 0.01 V rms.

   d. Counter should read .001 ms with decimal point correctly positioned and measurement unit displayed. Record results on test card.

2. FREQUENCY RANGE MULTIPLE PERIOD: 3 Hz to 2 MHz

   a. Set Counter controls as follows:

SENSITIVITY	.01 V
- LEVEL + ...	adjust for stable count
Function switch	10 PERIOD AVERAGE
SAMPLE RATE	cw out of POWER OFF

   b. Connect Signal Generator to Counter.

   c. Set Signal Generator output to 2 MHz at 0.01 V rms.

   d. Check Counter at each PERIOD AVERAGE setting, 10 through 100K. Record results on test card.

3. INPUT SENSITIVITY: 100 mV from 3 Hz to 1 kHz, 10 mV from 1 kHz to 2 MHz. Sensitivity checked in Range checks, procedures 1 and 2.

RATIO MEASUREMENTS

1. F1 FREQUENCY RANGE: 1 kHz to 10 MHz.

   a. Set Counter controls as follows:

SENSITIVITY	.01 V
- LEVEL + ...	adjust for stable count
Function switch	100 PERIOD AVERAGE
SAMPLE RATE	cw out of POWER OFF
FREQ STD	EXT
STORAGE	ON

   b. Connect f_2 100 kHz frequency standard to INPUT jack.

   c. Connect Signal Generator (f_1) to FREQ STD jack on rear panel. Set output to 2 MHz at 1V rms.

   d. Make checks indicated in the following table. Record results on test card.

f_1	f_2	X100 Periods Ratio Display
2.0 MHz	100 kHz	02000
1.5 MHz	100 kHz	01500
1.0 MHz	100 kHz	01000
500 kHz	100 kHz	00500
100 kHz	100 kHz	00100
50 kHz	100 kHz	00050
10 kHz	100 kHz	00010
1 kHz	100 kHz	00001

Table 5-3. In-Cabinet Performance Check Cont'd.

RATIO MEASUREMENTS Cont'd.

2. F2 FREQUENCY RANGE: 3 Hz to 1 MHz, Single Period
   3 Hz to 2 MHz, Multiple Period

   a. Set Counter controls as follows:

SENSITIVITY	.01 V
- LEVEL + ...	adjust for stable count
Function switch	10K PERIODS AVERAGED
SAMPLE RATE	cw out of POWER OFF
FREQ STD	EXT
STORAGE	ON

   b. Connect f_1 100 kHz frequency standard to FREQ STD jack on rear panel.

   c. Connect Signal Generator (f_2) to INPUT jack. Set output to 2 MHz at .01 V rms.

   d. Make checks shown in the following table. Record results on test card.

f_1	f_2	Periods Averaged	f_1/f_2 Display
100 kHz	2 MHz	10K	00500
100 kHz	1.5 MHz	10K	00660
100 kHz	1 MHz	10K	01000
100 kHz	500 kHz	10K	02000
100 kHz	100 kHz	10K	10000
100 kHz	50 kHz	10K	20000
100 kHz	10 kHz	10K	100000
100 kHz	1 kHz	1K	100000
100 kHz	500 Hz	1K	200000
100 kHz	100 Hz	100	100000
100 kHz	50 Hz	100	200000
100 kHz	10 Hz	10	100000
100 kHz	3 Hz	1	33333

3. SENSITIVITY: f_1: 1 kHz to 2 MHz, 1 V rms minimum
   f_2: 3 Hz to 1 kHz, 100 mV rms; 1 kHz to 2 MHz, 10 mV rms
   Sensitivity checked in procedures 1 and 2, Range checks.

TIME BASE

1. TIME BASE FREQUENCY: 1 MHz

   STABILITY: Aging Rate: $\pm$ 1 part in 10^6/month
   Temperature: $\pm$ 3 parts in 10^5 (+0° to +50°C)
   $\pm$ 5 parts in 10^6 (+10° to +40°C)
   Line Voltage: $\pm$ 1 part in 10^6 for $\pm$ 10% line voltage change

   a. Connect 1 MHz frequency standard to Oscilloscope trigger input.

   b. Connect Oscilloscope vertical input to Counter FREQ STD jack.

   c. Set Oscilloscope for external triggering and .1 μs/cm sweep.

   d. Horizontal drift of Oscilloscope pattern in cm/sec is difference between standard frequency and Counter time base frequency in parts in 10^6. Record.

   e. Record frequency difference. For long term stability, this test should be made daily for one month.

   f. Vary line voltage $\pm$ 10% and record frequency difference.

   g. Vary operating temperature from +10°C to +50°C and record frequency difference.

Table 5-3. In-Cabinet Performance Check Cont'd.

TIME BASE Cont'd.

2. OUTPUT FREQUENCY: 1 MHz at 3 V peak-to-peak

   a. Connect output of Counter FREQ STD jack to Oscilloscope vertical input.

   b. Oscilloscope should display a 1 MHz nonsinusoidal wave of 3 V peak-to-peak. Record frequency and amplitude on test card.

3. EXTERNAL INPUT: 1 MHz sine wave, 1 V rms

   a. Connect 1 MHz standard frequency to Counter FREQ STD jack.

   b. Set INT/EXT switch to EXT.

   c. Perform self check procedure, Figure 3-3.

   d. Record results on test card.

DISPLAY STORAGE

a. Set Counter controls as follows:

SAMPLE RATE	cw out of POWER OFF
SENSITIVITY	CHECK
Function switch	.01 sec
STORAGE	OFF

b. Counter should display 001.0000 MHz. The change in count should be visible in each digital display tube.

c. Set STORAGE switch to STORAGE position. The counter should count, display, and hold 1.0000 MHz and provide a continuous display of the most recent count. Record results on test card.

SAMPLE RATE

Variable from 50 ms to 5 sec.

a. Set Counter controls as follows:

SAMPLE RATE	POWER OFF
Function switch	.01 sec
SENSITIVITY	CHECK

b. Turn counter SAMPLE RATE control slightly cw out of POWER OFF, and note that counter turns on.

c. With SAMPLE RATE control in maximum position (ccw), observe gate light duration between gate closing and the following gate opening; it should be 50 ms.

d. Increase SAMPLE RATE control clockwise to minimum sample rate. Observe gate light duration between gate closing and the following gate opening; it should be more than 5 seconds.

e. Set SAMPLE RATE control to HOLD position. The last counter reading should remain displayed indefinitely. Record results on test card.

NOTE: This is a visual check and not an accurate check of the sample rate.

Table 5-3. In-Cabinet Performance Check Cont'd.

GATE INDICATOR

Front panel indication of main gate "open" state (GATE light on).

a. Set Counter controls as follows:

SAMPLE RATE	ccw out of POWER OFF
SENSITIVITY	CHECK
Function switch	1 s

b. Observe counter gate lamp, lamp should turn on and off at one second intervals. Record results on test card.

RESET CAPABILITY

A momentary control on the front panel that returns both the displayed and internal count to zero.

a. Set Counter controls as follows:

SAMPLE RATE	ccw out of POWER OFF
SENSITIVITY	CHECK
Function switch	1 s

b. Push front panel RESET pushbutton. Counter should reset and then start a new count.

c. Rotate function switch. As function is changed the counter should reset and start another count.

d. A remote contact closure or saturated NPN transistor to ground connected to RESET jack (rear panel) should reset counter and start a new count. Allow 30 ms between external reset pulse and start pulse.

DIGITAL OUTPUT

1. OUTPUT 4 LINE 1248 BCD CODE: Impedance 7500 ohm each line
"1" state level (H) +5 V
"0" state level (L) 0 V

a. Impedance determined by BCD output circuit on main board assembly A4.

b. Set Counter controls as follows:

SAMPLE RATE	ccw out of POWER OFF
Function switch	.1 sec
SENSITIVITY	.1 V

c. Connect signal source to counter INPUT jack.

d. Connect Oscilloscope to connections indicated on A4J1 to verify "0" state and "1" state levels. Oscilloscope will display step from "0" state (0 volts) to "1" state (+5 volts). Check all recorder outputs for "0" state and "1" state. Record on test card.

Table 5-3. In-Cabinet Performance Check Cont'd.

DIGITAL OUTPUT Cont'd.

1. OUTPUT 4 LINE 1248 BCD CODE

A4J1 Pins		A4J1 Pins	
17, 16, 15, 18	First Decoder A4IC33. Set Low Frequency Oscillator to 10 Hz at .1 V rms.	L, 9, 10, K	Fifth Decoder A4IC21. Set Signal Generator to 100 kHz at .1 V rms.
6, 7, 8, 5	Second Decoder A4IC30. Set Low Frequency Oscillator to 100 Hz at .1 V rms.	11, 13, 14, 12	Sixth Decoder A4IC18. Set Signal Generator to 1 MHz at .1 V rms.
F, H, J, E	Third Decoder A4IC27. Set Low Frequency Oscillator to 1 kHz at .1 V rms.	S, V, U, T	Seventh Decoder A4IC15. Set Signal Generator to 10 MHz at .1 V rms.
R, N, M, P	Fourth Decoder A4IC24. Set Low Frequency Oscillator to 10 kHz at .1 V rms.		

2. REFERENCE LEVELS: 0 volts and +5 volts, low impedance

   a. Set SAMPLE RATE control slightly clockwise out of POWER OFF.

   b. Connect DC Voltmeter to DIGITAL RECORDER jack A4J1 pins 3, C to check +5 V positive reference and A4J1 pins 1, A for 0 V reference. Record results on test card.

3. PRINT COMMAND: Positive step from 0 V to +5 V, dc coupled.

   a. Connect Oscilloscope to DIGITAL RECORDER jack A4J1 pin 4.

   b. Set Counter controls as follows:

SAMPLE RATE	cw out of POWER OFF
SENSITIVITY	CHECK
Function switch	.01 sec

   c. Oscilloscope should display the print command step (+5 V for each counting cycle). Record results on test card.

4. HOLD-OFF REQUIREMENTS: -10 V to -15 V

   a. Set Counter controls as follows:

SAMPLE RATE	cw out of POWER OFF
SENSITIVITY	CHECK
Function switch	10 sec
STORAGE	OFF

   b. With DC Power Supply, apply inhibit voltage, -10 volts, to DIGITAL RECORDER jack A4J1 pin 2. The counter should stop until the inhibit voltage is removed. Record results on test card.

   c. Repeat step b using -15 volt inhibit voltage. Record on test card. This check can be made using any inhibit voltage from -10 to -15 volts.

PERFORMANCE CHECK TEST CARD

Hewlett-Packard Model 5216A
Electronic Counter
Serial No. ___ - _____

Tests Performed by _____
Date _____

DESCRIPTION	CHECK
FREQUENCY MEASUREMENT	
1. Range: 3 Hz to 12.5 MHz	☐ 3 Hz to 12.5 MHz
2. Sensitivity: .01 V rms sine wave, 3 Hz to 12.5 MHz	☐ .01 V
3. Gate Times: 10, 1, .1, .01 seconds	☐ 10 sec ☐ 1 sec ☐ .1 sec ☐ .01 sec
4. Readout: 7 significant digits with decimal point and measurement unit display	☐ 7 digits
TIME INTERVAL MEASUREMENT	
1. Range: 10 μs to 10 s	☐ 10 μs to 10 s
PERIOD MEASUREMENT	
1. Range Single Period: 3 Hz to 1 MHz	☐ 3 Hz to 1 MHz
2. Range Multiple Period: 3 Hz to 2 MHz	☐ 3 Hz to 2 MHz
3. Sensitivity: .1 V, 3 Hz to 1 kHz; .01 V, 1 kHz to 2 MHz	☐ .1 V ☐ .01 V
RATIO MEASUREMENT	
1. f_1 Frequency Range: 1 kHz to 2 MHz	Ratio f_1/f_2 ☐ 02000 ☐ 01500 ☐ 01000 ☐ 00500 ☐ 00100 ☐ 00050 ☐ 00010 ☐ 00001
2. f_2 Frequency Range: 3 Hz to 1 MHz Single Period 3 Hz to 2 MHz Multiple Period	☐ 00500 ☐ 00660 ☐ 01000 ☐ 02000 ☐ 10000 ☐ 20000 ☐ 10000 ☐ 100000 ☐ 200000 ☐ 100000 ☐ 200000 ☐ 100000 ☐ 33333

PERFORMANCE CHECK TEST CARD

DESCRIPTION	CHECK
RATIO MEASUREMENT Cont'd.	
3. Sensitivity: f_1 1 V rms min, 1 kHz to 2 MHz f_2 .1 V rms, 3 Hz to 1 kHz .01 V rms, 1 kHz to 2 MHz	☐ f_1 ☐ f_2
TIME BASE FREQUENCY: 1 MHz	
1. Stability: Aging Rate: ± 1 part in 10^6/month	☐ less than ± 1 part in 10^6/month
Temperature: ± 3 parts in 10^5 (0°C to +50°C)	☐ ± 3 parts in 10^5
± 5 parts in 10^6 (+10°C to +40°C)	☐ ± 5 parts in 10^6
Line Voltage: ± 1 part in 10^6 for ± 10% change	☐ less than ± 1 part in 10^6
2. Output Frequency: 1 MHz, 3 V peak-to-peak	☐ 1 MHz, 3 V peak-to-peak
3. External Input: 1 MHz sine wave, 1 V rms	☐ 1 MHz
SAMPLE RATE	
Variable from 50 ms to 5 seconds	☐ less than 50 ms to greater than 5 seconds
DISPLAY STORAGE	☐ count stored
GATE INDICATOR	
Front panel indication of main gate "open" state.	☐ gate light flashes
RESET CAPABILITY	
Manual Reset switch	☐ counter resets
Function switch	☐ counter resets
Remote Reset	☐ counter resets
DIGITAL OUTPUT	
1. Output 4 line 1248 BCD Code: "1" state level +5V	☐ +5 V
"0" state level 0V	☐ 0 V
2. Reference Levels: 0 volts and +5 volts low impedance	☐ +5 V A4J1 (3, C) ☐ 0 V A4J1 (1, A)
3. Print Command: Positive step from 0 V to +5 V dc coupled.	☐ +5 volts A4J1 (4)
4. Hold-off Requirements: -10 V to -15 V	☐ -10 V A4J1 (2) ☐ -15 V A4J1 (2)

Figure 5-2. Bottom and Sides Internal Views

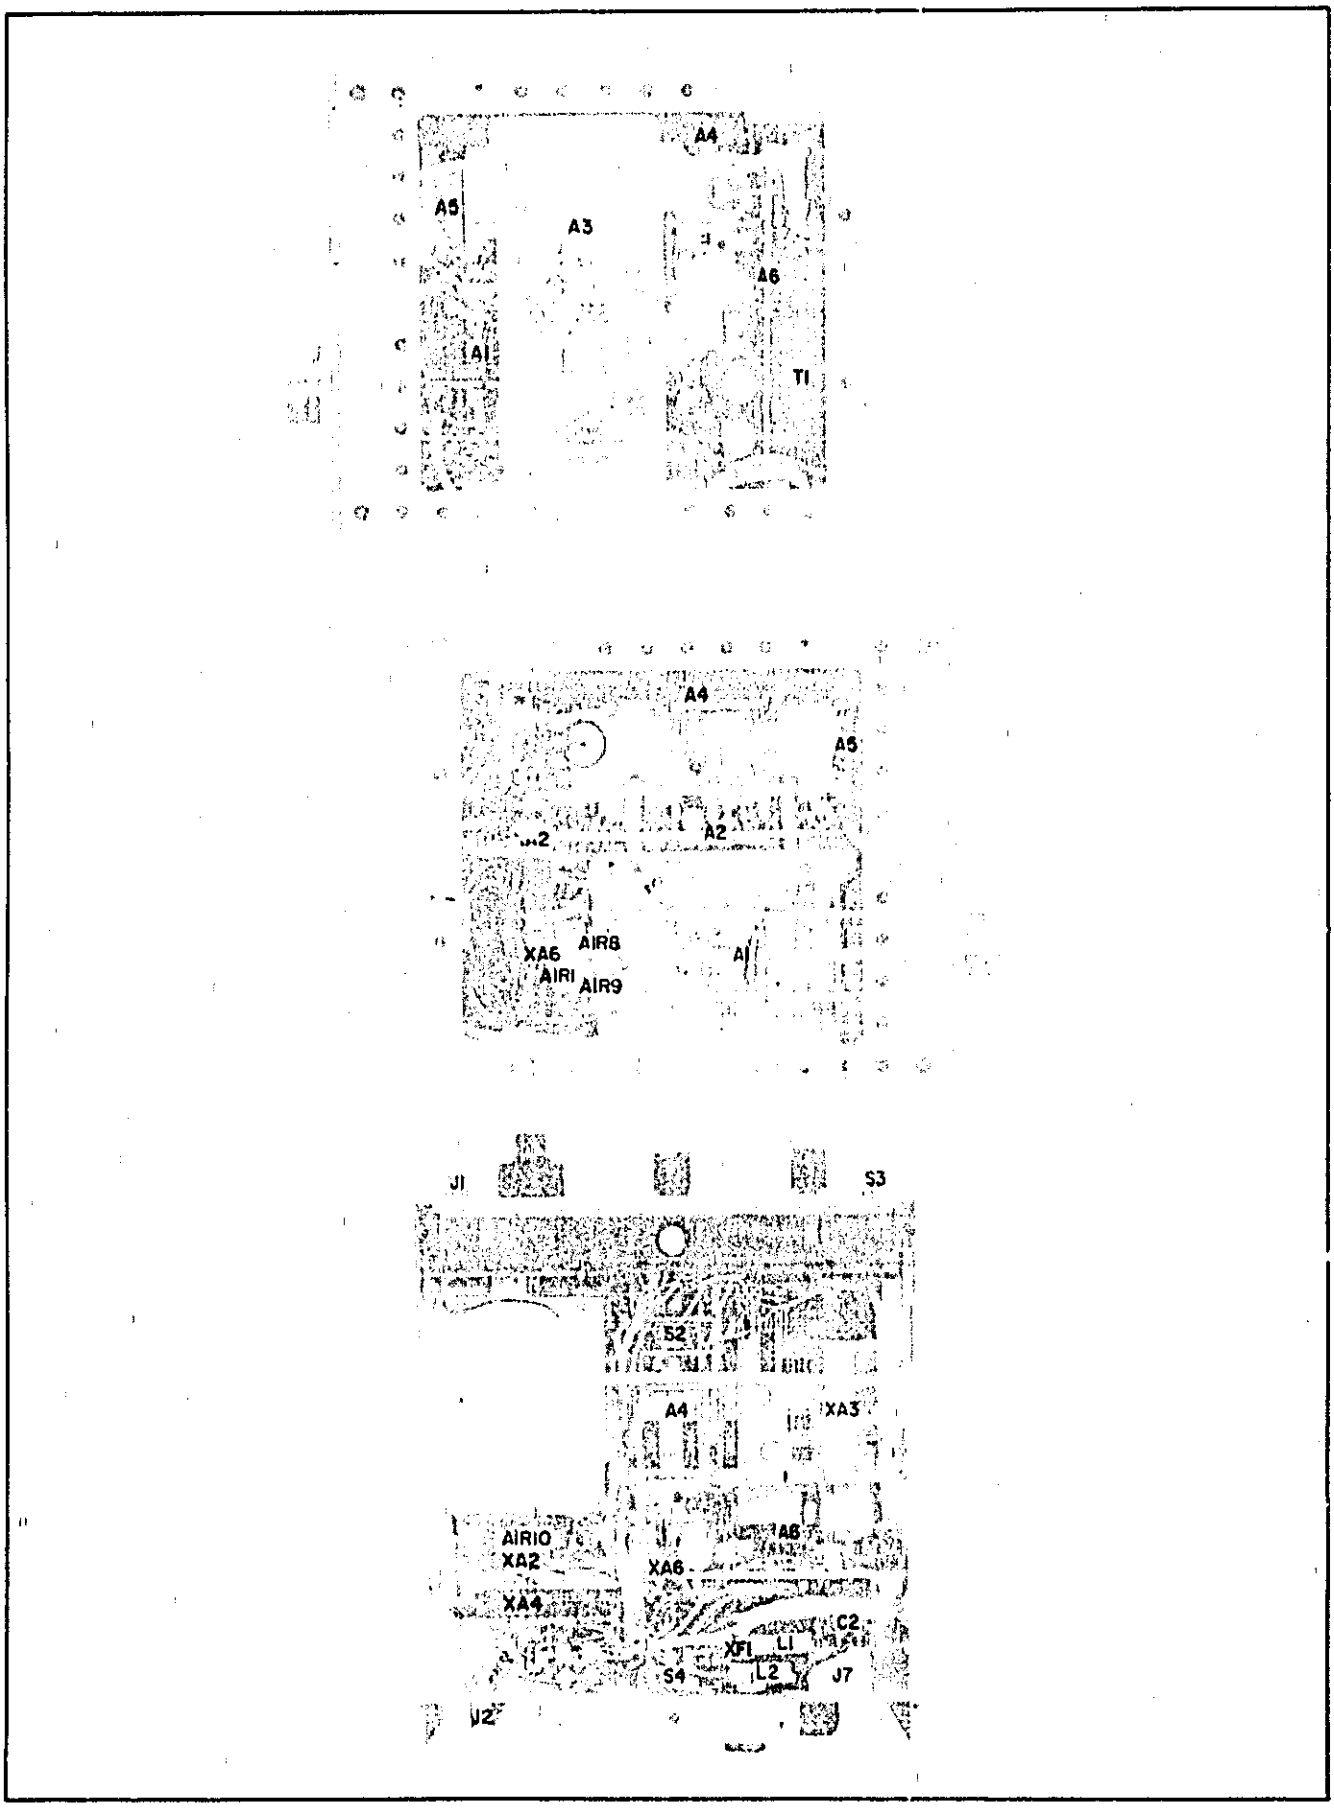

Table 5-4. Front Panel Troubleshooting Check

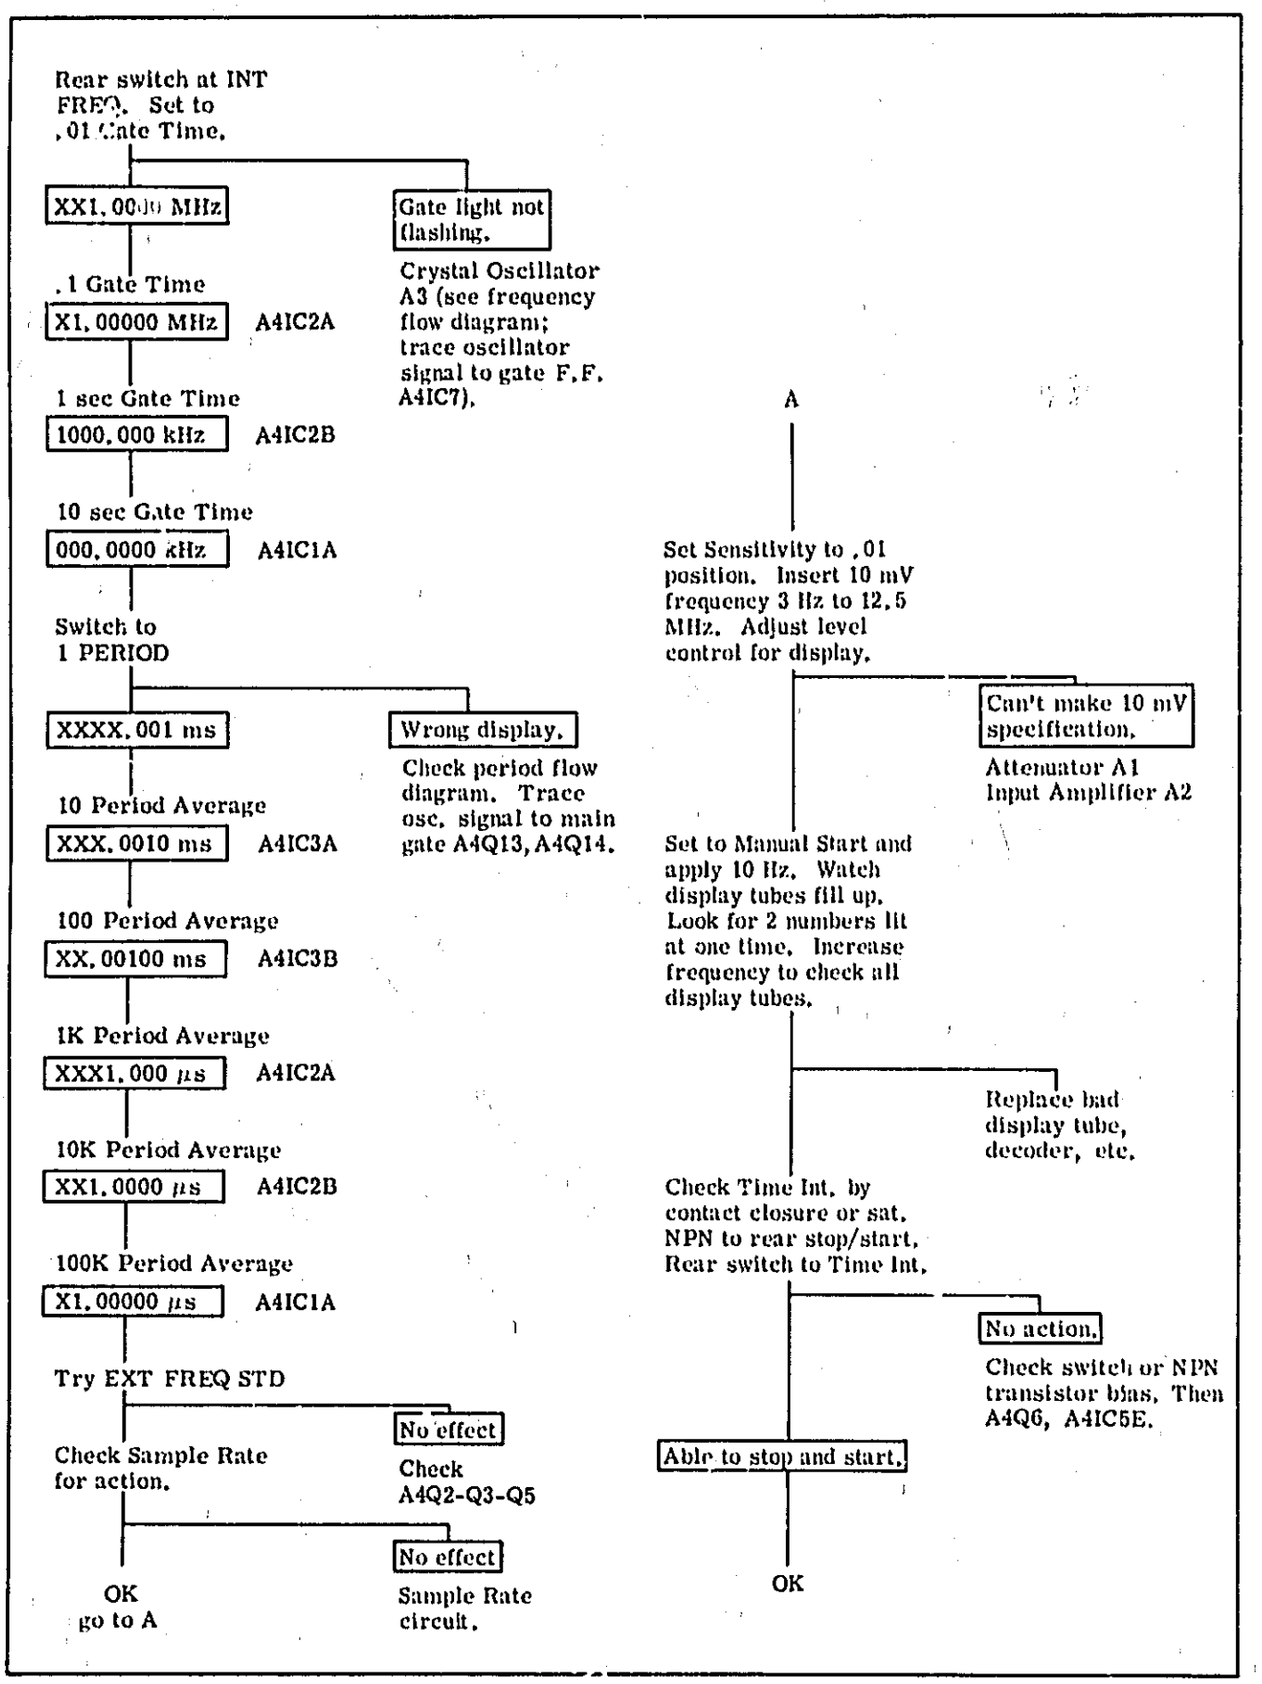
Set Counter controls as follows:

SENSITIVITY	.01
function	MANUAL START
SAMPLE RATE	cw out of POWER OFF
STORAGE	ON
FREQ STD	INT
FREQ-PER/TIME INT	FREQ-PER
INPUT	no input signal used

Reset Counter and begin check.

- **Gate light on and at least one digit displayed.**
  - Storage switch off. Reset counter.
  - Display 0000000 — If other than zeros appear check associated decade, buffer, decoder and display tube (be sure A4Q8, A4IC8C reset is working).
  - Storage switch on. Reset counter.
  - X = blank XX00000 — If all zeros, check storage switch or transfer one-shot multivibrator A4IC8D and IC9A.
  - Sensitivity switch to check. Reset counter.
    - **Count totalized to fill display.**
      - Front panel switch at stop (gate closed).
        - **Gate light off. Display on tubes.**
        - **Gate light on.** A4CR13, A4CR18 A4CR17
    - **No count or partial fill up.** Attenuator A1, Input Amplifier A2, Crystal Oscillator A3, A4Q4, A4IC5, A4Q12, A4Q11, High speed decade down to where count stops.
- **Gate light off but at least one digit displayed.**
  - IC7 Main Gate F. F.
    - $\bar{Q}$ = 0 V — A4Q16, DS1
    - $\bar{Q}$ = .5 V — Check inputs to IC7.
- **No gate light no display.** Fuse - check Power Supply: +155 V, +5.1 V, +5 V, -5.8 V

Table 5-4. Front Panel Troubleshooting, Check Cont'd.



5-16. Substitution

5-17. Replacing the assembly suspected of trouble with a spare assembly known to be operating can greatly simplify troubleshooting. When a defective assembly is found, the trouble can then be traced to individual components. The defective assembly can be shipped to the nearest Hewlett-Packard Sales and Service office for repair.

5-18. Printed Circuit Component Replacement

5-19. Component lead holes in the circuit boards have plated walls to ensure good electrical contact between conductors on opposite sides of the board. To prevent damage to this plating, apply heat sparingly and work carefully. The following replacement procedure is recommended:

a. Remove defective component by first heating terminals on either side of board until solder melts. Then gently remove part with long nose pliers. Use a clean, 37 watt soldering iron.

b. Melt solder in component lead holes. Clean holes with toothpick or wooden splinter. Do not use a metal tool for cleaning holes.

c. Shape component leads and insert into cleaned holes. Solder into place using heat and solder sparingly; a heat sink such as long nose pliers or a commercial heat sink should be used when replacing transistors or diodes.

d. Through-hole plating breaks are indicated by separation of the round conductor pad from other side of the board. To repair breaks, press conductor pad against board and solder replacement component lead to conductor pads on both sides of board.

5-20. ADJUSTMENTS

5-21. Adjustment procedures for the 10 MHz Oscillator and the Power Supply are given in Paragraphs 5-22 and 5-24. The listings are in the preferred order of adjustment.

5-22. Power Supply Assembly A6

5-23. To adjust the +5.1V supply:

a. Connect DC Voltmeter to A6(2).

b. Turn on Counter.

c. Adjust A6R7 for +5.1V ±.02V.

5-24. 1 MHz Oscillator Assembly A3

5-25. To check Oscillator frequency, use test setup in Figure 5-3.

NOTE

For best long term stability, the Counter should warm up for 24 hours before checking frequency.

a. Connect 1 MHz standard to EXT SYNC input on Oscilloscope.

b. Connect output from 5216A FREQ STD jack to Oscilloscope Vertical Input.

c. Adjust A3C5 (Coarse) and A3C6 (Fine) until sine wave display is stationary.

Figure 5-3. Oscillator Frequency Test Setup

PARTS LIST

SECTION VI

REPLACEABLE PARTS

6-1. INTRODUCTION

6-2. This section contains information for ordering replacement parts. Table 6-1 lists parts in alpha-numerical order of their reference designators and indicates the description and HP part number of each part, together with any applicable notes. Table 6-2 lists parts in alpha-numerical order of their HP part number and provides the following information on each part.

a. Description of the part (see list of abbreviations below).

b. Typical manufacturer of the part in a five-digit code; see list of manufacturers in Table 6-3.

c. Manufacturer's part number.

d. Total quantity used in the instrument (TQ column).

6-3. Miscellaneous parts are listed at the end of Table 6-1.

6-4. ORDERING INFORMATION

6-5. To obtain replacement parts, address order or inquiry to your local Hewlett-Packard Sales and Service office (see lists at rear of this manual for addresses). Identify parts by their Hewlett-Packard part numbers.

6-6. To obtain a part that is not listed, include:

a. Instrument model number.

b. Instrument serial number.

c. Description of the part.

d. Function and location of the part.

Table 6-3. Code List of Manufacturers

The following code numbers are from the Federal Supply Code for Manufacturers Cataloging Handbooks H6-1 (Name to Code) and H6-2 (Code to Name) and their latest supplements. The date of revision and the date of the supplements used appear at the bottom of each page. Alphabetical codes have been arbitrarily assigned to suppliers not appearing in the H4 Handbooks.

Code No.	Manufacturer	Address
00000	U.S.A Common	Any supplier of U.S.
00136	McCoy Electronics	Mount Holly Springs, Pa.
00213	Sage Electronics Corp	Rochester, N.Y.
00287	Cemco, Inc.	Danielson, Conn.
00334	Humidial	Colton, Calif.
00348	Micitron, Co., Inc.	Valley Stream, N.Y.
00373	Garlock Inc.	Cherry Hill, N.J.
00656	Aerovox Corp.	New Bedford, Mass.
00779	Amp, Inc.	Harrisburg, Pa.
00781	Aircraft Radio Corp.	Boonton, N.J.
00809	Crowen, Ltd.	Whitby, Ontario, Canada
00815	Northern Engineering Laboratories, Inc.	Burlington, Wis
00853	Sangamo Electric Co., Pickens Div.	Pickens, S.C.
00856	Gee Engineering Co.	City of Industry, Cal.
00891	Carl E. Holmes Corp.	Los Angeles, Cal.
00929	Microlab Inc.	Livingston, N.J.
01002	General Electric Co., Capacitor Dept	Hudson Falls, N.Y.
01009	Alden Products Co.	Brockton, Mass.
01121	Allen Bradley Co.	Milwaukee, Wis
01255	Litton Industries, Inc.	Beverly Hills, Cal.
01281	TRW Semiconductors, Inc.	Lawndale, Cal.
01295	Texas Instruments, Inc., Transistor Products Div.	Dallas, Texas
01349	The Alliance Mfg. Co	Alliance, Ohio
01538	Emall Parts Inc.	Los Angeles, Cal.
01589	Pacific Relays, Inc.	Van Nuys, Cal.
01670	Gudebrod Bros. Silk Co	New York, N.Y.
01930	Amerock Corp.	Rockford, Ill.
01960	Pulse Engineering Co	Santa Clara, Cal.
02114	Ferroxcube Corp. of America	Saugerties, N.Y.
02116	Wheelock Signals, Inc.	Long Branch, N.J.
02286	Cole Rubber and Plastics Inc.	Sunnyvale, Cal.
02660	Amphenol-Borg Electronics Corp	Broadview, Ill.
02735	Radio Corp. of America, Semiconductor and Materials Division	Somerville, N.J.
02771	Vocaline Co of America, Inc.	Old Saybrook, Conn.
02777	Hopkins Engineering Co.	San Fernando, Cal.
02875	Hudson Tool & Die	Newa N.J.
03296	Nylon Molding Corp.	Springfield, N.J.
03508	G.E. Semiconductor Prod. Dept	Syracuse, N.Y.
03705	Apex Machine & Tool Co.	Dayton, Ohio
03797	Eldema Corp.	Compton, Calif.
03816	Parker Seal Co.	Los Angeles, Cal.
03877	Transitron Electric Corp.	Wakefield, Mass.
03888	Pyrofilm Resistor Co., Inc.	Cedar Knolls, N.J.
03954	Singer Co., Diehl Div., Finderne Plant	Somerville, N.J.
04009	Arrow, Hart and Hegeman Elect. Co.	Hartford, Conn.
04013	Taruna Corp.	Lambertville, N.J.
04062	Aero Electronic Inc.	Great Neck, N.Y.
04217	Essex Wire	Los Angeles, Cal.
04222	Hi-Q Division of Aerovox	Myrtle Beach, S.C.
04354	Precision Paper Tube Co.	Wheeling, Ill.
04404	Palo Alto Division of Hewlett-Packard Co.	Palo Alto, Cal.
04451	Sylvania Electric Products, Microwave Device Div.	Mountain View, Cal.
04673	Dakota Engr. Inc.	Culver City, Cal.
04713	Motorola Inc. Semiconductor Prod. Div.	Phoenix, Arizona
04732	Filtron Co., Inc. Western Div.	Culver City, Cal.
04773	Automatic Electric Co.	Northlake, Ill.
04796	Sequoia Wire Co.	Redwood City, Cal.
04811	Precision Coil Spring Co.	El Monte, Cal.
04870	P.M. Motor Company	Westchester, Ill.
04919	Component Mfg. Service Co.	W. Bridgewater, Mass.
05006	Twentieth Century Plastics, Inc.	Los Angeles, Cal.
05277	Westinghouse Electric Corp. Semiconductor Dept.	Youngwood, Pa.
05347	Ultronix, Inc.	San Mateo, Cal.
05397	Union Carbine Corp, Elect. Div.	New York, N.Y.
05574	Viking Ind. Inc.	Canoga Park, Cal.
05583	Icore Electro-Plastics Inc.	Sunnyvale, Cal.
05616	Cosmo Plastic (con Electrical Spec. Co)	Cleveland, Ohio
05624	Barber Colman Co.	Rockford, Ill.
05728	Tiffen Optical Co.	Roslyn Heights, Long Island, N.Y.
05729	Metro-Tel Corp.	Westbury, N.Y.
05783	Stewart Engineering Co	Santa Cruz, Cal.
05820	Wakefield Engineering Inc.	Wakefield, Mass.
06004	Bassick Co., Div. of Stewart Warner Corp.	Bridgeport, Conn.
06090	Raychem Corp	Redwood City, Cal.
06175	Bausc and Lomb Optical Co.	Rochester, N.Y
06402	E.T. & Products Co. of America	Chicago, Ill.
06540	Amatom Electronic Hardware Co., Inc.	New Rochelle, N.Y.
06555	Beede Electrical Instrument Co., Inc.	Penacook, N.H.
06666	General Devices Co., Inc.	Indianapolis, Ind.
06751	Components Inc., Ariz. Div.	Phoenix, Arizona
06812	Torrington Mfg Co., West Div.	Van Nuys, Cal
06980	Varian Assoc. Elmac Div.	San Carlos, Cal.
07006	Kelvin Electric Co.	Van Nuys, Cal.
07126	Digitran Co	Pasadena, Cal.
07137	Transistor Electronics Corp.	Minneapolis, Minn.
07138	Westinghouse Electric Corp., Electronic Tube Div.	Elmira, N.Y.
07149	Filmohm Corp.	New York, N.Y.

BACK DATING MANUAL CHANGES

SECTION VII

MANUAL CHANGES

7-1. CURRENT INSTRUMENTS

7-2. This manual applies directly to Model 5216A Electronic Counters with serial prefix number 1040A (refer to Paragraph 1-7).

7-3. NEWER INSTRUMENTS

7-4. As changes are made, newer instruments may have serial numbers not listed in this manual. The manuals for these instruments will be supplied with an additional "Manual Changes" sheet containing the required information; contact your nearest Hewlett-Packard Sales and Service office for information if this sheet is missing.

7-5. OLDER INSTRUMENTS

7-6. This manual with the changes listed in Table 7-1 also applies to 5216A Electronic Counters having serial prefix numbers 976- and below.

Table 7-1. Back-dating Manual Changes

SERIAL PREFIX	MAKE MANUAL CHANGE
976-	1
940-	1, 2
916-	1, 2, 3
748-	1, 2, 3, 4
744-	1, 2, 3, 4, 5
712-, 716	1, 2, 3, 4, 5, 6

CHANGE 1

Page 1-1, Table 1-1:
Change detachable power cord Part No. to 8120-0078

Page 6-5, Table 6-1:
Change F1 2110-0033 to 2110-0018
J7 1251-2357 to 1251-0148

Page 6-6, Table 6-1:
Change S4 3101-1234 to 3101-0033
W1 8120-1348 to 8120-0078

Page 6-7, Figure 6-1:
Change Rear Panel Part No. to 05216-0004

Page 6-8, Table 6-2:
Change 1251-2357 to 1251-0148; Mfr. No. to 87930; Mfr. Part No. to 1065-1

Page 6-9, Table 6-2:
Change 8120-1348 to 8120-0078; Mfr. No. to 28480; Mfr. Part No. 8120-0078
Change 05216-0009 to 05216-0004; Mfr. Part No. to 05216-0004

Page 8-27, Figure 8-11:
Use primary power supply schematic marked "PRE-IEC PRIMARY POWER SUPPLY"

CHANGE 2:

Table 6-1:

Delete A4-05216-6013 Main Board Assembly and all lines prefixed by A4; replace with Table 7-2, A4-05216-6011 Main Board Assembly.

Delete A6-05216-6012 Power Supply Assembly and all lines prefixed by A6; replace with Table 7-3, A6-05216-6002 Power Supply Assembly.

Delete W3-05216-6014 Cable, Gate Light.

Change T1 from 9100-3004 Transformer to 9100-2438.

Delete A1C7 0150-0050 C:FXD 1000 pf.

Change A1R6 from 0683-1035 R:FXD 10K ohm to 0684-1011 R:FXD 100 ohm 5% 1/4W.

Change A1R8 from 0683-1035 R:FXD 10K ohm to 0683-2025 R:FXD 2K ohm 5% 1/4W.

Change A1CR1 and A1CR2 from 190' -0050 Diode to 1910-0016 Diode Germanium 60WIV.

Delete Figures 8-3, 8-4, 8-5, 8-6, 8-7, 8-9, and 8-10 (sheets 1, 2, and 3), and 8-11.
(Note: Figures 8-3, 8-4, 8-5, and 8-6 will not be replaced.)
Replace Figures 8-7, 8-9, 8-10, and 8-11 with Figures 7-1, 7-2, 7-3, 7-4, 7-5, and 7-6.

Page 7-5, Table 7-2:
Change A4IC35 to 1820-0117 Circuit HP.

CHANGE 3:

Table 7-2:
Add A4C5 0140-0221 C:FXD MICA 220 pf 1%
Add A4CR10 1910-0016 Diode:Germanium 100 MA

Delete Figure 7-3. Replace with Figure 7-7.

CHANGE 4:

Page 5-1, Table 5-1:
Change A3 to 10 MHz oscillator 05216-6006
Change A4 to Main Board 05216-6001

Page 5-5, Table 5-3:
Change TIME BASE to read as follows:

TIME BASE

1. TIME BASE FREQUENCY: 10 MHz
   STABILITY: Aging Rate: less than $\pm 2 \times 10^{-6}$/month
   Temperature: less than $\pm 1 \times 10^{-5}$ from +15°C to +35°C
   less than $\pm 3 \times 10^{-5}$ from 0°C to +50°C
   Line Voltage: less than 1×10^{-6} for ± 10% change

   a. Connect output of Counter FREQ STD jack to Oscilloscope vertical input.

   b. Trigger Oscilloscope externally with a 1 MHz signal from a standard frequency source.

   c. Set Oscilloscope sweep time to 1 μs/cm.

   d. Horizontal drift of Oscilloscope in cm/sec is difference between standard frequency and counter time base frequency in parts in 10^6.

CHANGE 4 (Continued):

Page 5-5, Table 5-3 (Continued)

e. Record frequency difference. For long term stability, this test should be made daily for a period of one month.

NOTE: Temperature must be kept constant, or compensation for temperature difference must be made whenever a frequency difference is recorded. Unless a record of the temperature and date of last calibration is available, the frequency offset should not be considered drift or aging rate of the 10 MHz crystal.

f. Vary line voltage ± 10% and record frequency difference on test card.

NOTE: Stability as a function of temperature may be checked by performing steps g and h.

g. Vary operating temperature from +15°C to +35°C and record frequency difference.

h. Vary operating temperature from 0°C to +50°C and record frequency difference.

Page 5-8a-b, PERFORMANCE CHECK TEST CARD:

Change TIME BASE FREQUENCY to read as follows:

TIME BASE FREQUENCY: 10 MHz

1. Stability:	Aging Rate: less than $\pm 2 \times 10^{-6}$/month	less than $\pm 2 \times 10^{-6}$/mo.
	Temperature: less than $\pm 1 \times 10^{-5}$	
	from +15°C to +35°C	less than $\pm 1 \times 10^{-5}$
	less than $\pm 3 \times 10^{-5}$	
	from 0°C to +50°C	less than $\pm 3 \times 10^{-5}$
	Line Voltage: less than 1×10^{-6}	
	for ± 10% change	less than 1×10^{-6}

Table 6-1:
Delete A3-05216-6010 Oscillator Assembly and all lines refixed by A3; replace with Table 7-4, A3-05216-6006 Oscillator Assembly.

Table 7-2:
Change A4-05216-6013 to 0521C-6001

Change 05216-2013 to 05216-2001

Add A4C3 0160-0168 C:FXD MY 0.1UF 10% 200VDCW.

Change A4CR26, A4CR27 to 1902-3404 Diode:Zener.

Change A4IC1, A4IC2, A4IC3, A4IC4, A4IC5, A5IC6, A4IC7, A4IC8 to 1820-0098 Circuit: Integrated.

Change A4R1, A4R2, A4R3, A4R4 to 0675-1021 R:FXD Carbon 1000 ohm 10% 1/8W.

Change A4R5 to 0683-1025 R:FXD COMP 1000 ohm 5% 1/4W.

Change A4R6 to 0675-1021 R:FXD Carbon 1000 ohm 10% 1/8W.

Change A4R10 to 0683-6815 R:FXD COMP 680 ohm 5% 1/4W.

Change A4R12 to 0698-5103 R:FXD COMP 530 ohm 5% 1/8W.

Replace Figures 7-2, 7-4, and 7-7 with Figures 7-9, 7-10, and 7-11.
Replace Figure 8-6 with Figure 7-12.
Change A4IC35 to 1820-0254* Circuit HP.

*1820-0254 is replacement part for 1820-0079 and when used A4R42 must be changed to 51 ohms. Hence, change A4R42 to 0683-5105 51 OHM when this IC replacement is made.

CHANGE 5:

Figure 7-1:
Change A1R3 from 2000 ohms to 10K ohms.

Delete A1CR1 and A1CR2.

Table 6-1:
Change A1R8 to 0683-1035 R:FXD COMP 10K ohms 5% 1/4W.

Delete A1CR1 and A1CR2 (not assigned)

CHANGE 6:

Figure 7-8:
Change A4R10 from 680 ohms to 470 ohms

Figure 7-9:
Delete CR1 between XA4(J) and XA4(15).
Delete CR2 in parallel with DS1 (GATE light).

Figure 7-3:
Change A6R3 from 220 ohms to 430 ohms.

Table 7-2:
Change A4R10 to 0683-4715 R:FXD COMP 470 ohm 5% 1/4W.

Table 7-3:
Change A6CR13 to 1902-3193 Diode, Sil 13.3V

Change A6R3 to 0683-4315 R:FXD COMP 430 ohm 5% 1/4W.

Table 6-1:
Delete CR1 and CR2.

SCHEMATIC DIAGRAMS

SECTION VIII

CIRCUIT DIAGRAMS

8-1. INTRODUCTION

8-2. This section includes the following:

a. General Notes for Schematic Diagrams (Figure 8-1).

b. Functional flow diagrams for the gating section of Main Board Assembly A4 (Figures 8-2 through 8-5).

c. Schematic Diagrams and Component Location Illustrations of Model 5216A printed circuit assemblies in the order of their assembly designation (A1 through A6, Figures 8-6 through 8-11). These figures may also include waveforms and voltages. Top view of integrated circuits is shown with pin numbers for identification.

8-3. The Flow Diagrams or any schematic diagram, when unfolded, can be used with any other part of this manual, or with the manual closed.

8-4. DC Voltages are measured with a HP Model 412A DC Voltmeter. Typical voltages are shown.

8-5. Waveforms taken with a HP Model 175A Oscilloscope with the HP 1755A Dual Trace Amplifier plug-in installed. Oscilloscope vertical amplifier bandwidth is at least 20 MHz when used with 10:1 divider probe HP 10001A.

8-6. Shaded areas on the schematic diagrams indicate printed circuit board assemblies. All components within the shaded areas are mounted on the boards.

Figure 8-1. Schematic Diagram Notes

SYMBOLS

- FRONT PANEL
- REAR PANEL
- KNOB CONTROL
- SCREWDRIVER ADJUST
- MAIN SIGNAL PATH
- FEEDBACK PATH
- CONDUCTING ELEMENT
- WIPER MOVES TOWARD "CW" WHEN CONTROL IS ROTATED CLOCKWISE
- POWER LINE GROUND
- CIRCUIT COMMON GROUND
- TEST POINT
- "AND" GATE
- INHIBIT GATE
- "OR" GATE
- WAVEFORMS SHOWN ARE TYPICAL

SWITCH DESIGNATIONS

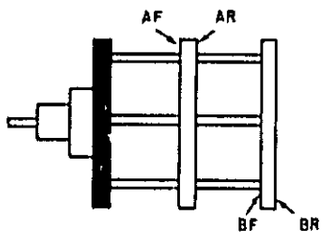
A3S1	SWITCH S1 WITHIN ASSEMBLY A3
B	2ND WAFER FROM FRONT (A=1ST, ETC)
R	REAR OF WAFER (F=FRONT)
(2-1/2)	TERMINAL LOCATION (2-1/2) (VIEWED FROM FRONT)



REFERENCE DESIGNATIONS

REFERENCE DESIGNATIONS WITHIN ASSEMBLIES ARE ABBREVIATED. ADD ASSEMBLY NUMBER TO ABBREVIATION FOR COMPLETE DESCRIPTION.

ASSEMBLY	ABBREVIATION	COMPLETE DESCRIPTION
A25	C1	A25C1
A25A1	CR1	A25A1CR1
NO PREFIX	J3	J3

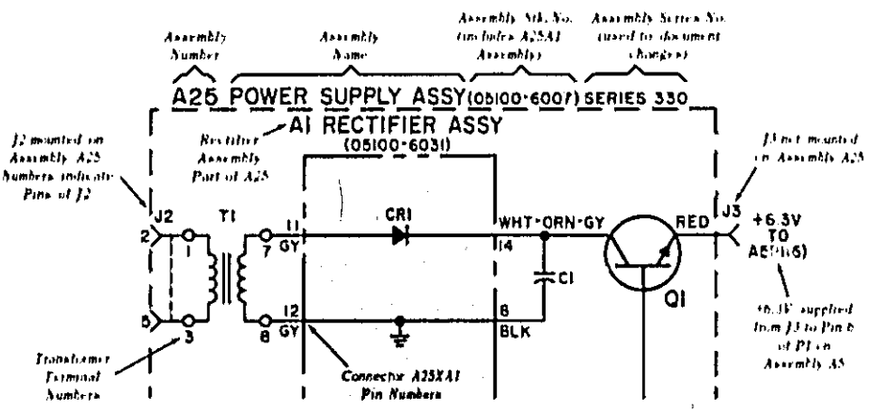


Figure 8-2. Integrated Circuit Diagram

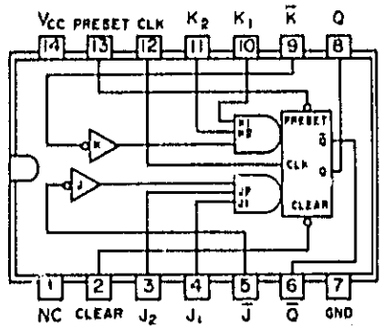


1820-0065(SN7470N)
J-K FLIP-FLOP

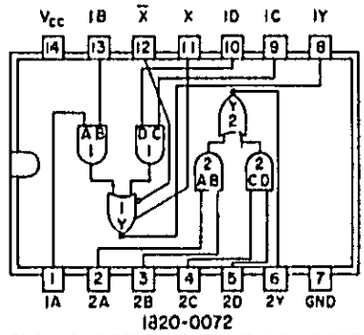
POSITIVE LOGIC
LOW INPUT TO PRESET SETS Q TO LOGICAL 1
LOW INPUT TO CLEAR SET Q TO LOGICAL 0

TRUTH TABLE

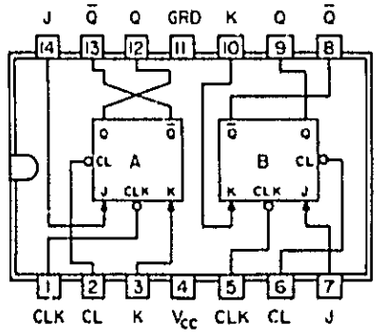
t_n		t_{n+1}
J	K	Q
0	0	Q_n
0	1	0
1	0	1
1	1	$\bar{Q}_n$

NOTE:
CLOCK MUST BE AT LOGICAL 0 PRIOR TO THE APPLICATION OF PRESET OR CLEAR FUNCTIONS.

NOTES:
1. J = J1 , J2 , $\bar{J}$
2. K = K1 , K2 , $\bar{K}$
3. t_n = BIT TIME BEFORE CLOCK PULSE
4. $t_n + 1$ = BIT TIME AFTER CLOCK PULSE



1820-0072
DUAL 2-WIDE 2-INPUT AND-OR-INVERT GATES (SN7450N)
POSITIVE LOGIC
Y = (AB) + (CD) + X
X = ABCD from SN7460N



1820-0075(SN7473N)
DUAL J-K MASTER-SLAVE FLIP-FLOP

TRUTH TABLE
(EACH FLIP-FLOP)

t_n		t_{n+1}
J	K	Q
0	0	Q_n
0	1	0
1	0	1
1	1	$\bar{Q}_n$

NOTES
1 t_n = BIT TIME BEFORE CLOCK PULSE
2 t_{n+1} = BIT TIME AFTER CLOCK PULSE
3 POSITIVE LOGIC:
LOW INPUT TO CLEAR SETS Q TO LOGICAL 0 REGARDLESS OF CLOCK STATE
